[38151] It is yet further appreciated that a function of VGAM1038 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1038 include diagnosis, prevention and treatment of viral infection by Mollusum Contagiosum Virus. Specific functions, and accordingly utilities, of VGAM1038 correlate with, and may be deduced from, the identity of the host target genes which VGAM1038 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[38152] Nucleotide sequences of the VGAM1038 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1038 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1038 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1038 are further described hereinbelow with reference to Table 1.

[38153] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1038 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1038 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[38154] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM1038 gene, herein designated VGAM is inhibition of expression of VGAM1038 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1038 correlate with, and may be deduced from, the identity of the target genes which VGAM1038 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[38155] Chaperone, ABC1 Activity of Bc1 Complex Like (*S. pombe*) (CABC1, Accession NM_020247) is a VGAM1038 host target gene. CABC1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CABC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CABC1 BINDING SITE, designated SEQ ID:21540, to the nucleotide sequence of VGAM1038 RNA, herein designated VGAM RNA, also designated SEQ ID:3749.

[38156] A function of VGAM1038 is therefore inhibition of Chaperone, ABC1 Activity of Bc1 Complex Like (*S. pombe*) (CABC1, Accession NM_020247). Accordingly, utilities of VGAM1038 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CABC1.

Neuron Navigator 2 (NAV2, Accession XM_012028) is another VGAM1038 host target gene. NAV2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NAV2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NAV2 BINDING SITE, designated SEQ ID:30203, to the nucleotide sequence of VGAM1038 RNA, herein designated VGAM RNA, also designated SEQ ID:3749.

[38157] Another function of VGAM1038 is therefore inhibition of Neuron Navigator 2 (NAV2, Accession XM_012028), a gene which plays an important role in neuronal development, including neurite outgrowth. Accordingly, utilities of VGAM1038 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NAV2. The function of NAV2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM481. Promyelocytic Leukemia (PML, Accession NM_033245) is another VGAM1038 host target gene. PML BINDING SITE1 and PML BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of

mRNA encoded by PML, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PML BINDING SITE1 and PML BINDING SITE2, designated SEQ ID:27084 and SEQ ID:27080 respectively, to the nucleotide sequence of VGAM1038 RNA, herein designated VGAM RNA, also designated SEQ ID:3749.

[38158] Another function of VGAM1038 is therefore inhibition of Promyelocytic Leukemia (PML, Accession NM_033245). Accordingly, utilities of VGAM1038 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PML. DKFZP547L112 (Accession XM_039353) is another VGAM1038 host target gene. DKFZP547L112 BINDING SITE1 and DKFZP547L112 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by DKFZP547L112, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP547L112 BINDING SITE1 and DKFZP547L112 BINDING SITE2, designated SEQ ID:33059 and SEQ ID:33055 respectively, to the nucleotide sequence of VGAM1038

RNA, herein designated VGAM RNA, also designated SEQ ID:3749.

[38159] Another function of VGAM1038 is therefore inhibition of DKFZP547L112 (Accession XM_039353). Accordingly, utilities of VGAM1038 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP547L112. KIAA1691 (Accession XM_166523) is another VGAM1038 host target gene. KIAA1691 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1691, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1691 BINDING SITE, designated SEQ ID:44460, to the nucleotide sequence of VGAM1038 RNA, herein designated VGAM RNA, also designated SEQ ID:3749.

[38160] Another function of VGAM1038 is therefore inhibition of KIAA1691 (Accession XM_166523). Accordingly, utilities of VGAM1038 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1691. KIAA1856 (Accession XM_166549) is another VGAM1038 host target gene. KIAA1856 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by KIAA1856, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1856 BINDING SITE, designated SEQ ID:44521, to the nucleotide sequence of VGAM1038 RNA, herein designated VGAM RNA, also designated SEQ ID:3749.

[38161] Another function of VGAM1038 is therefore inhibition of KIAA1856 (Accession XM_166549). Accordingly, utilities of VGAM1038 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1856. PRO0386 (Accession NM_018562) is another VGAM1038 host target gene. PRO0386 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PRO0386, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO0386 BINDING SITE, designated SEQ ID:20647, to the nucleotide sequence of VGAM1038 RNA, herein designated VGAM RNA, also designated SEQ ID:3749.

[38162] Another function of VGAM1038 is therefore inhibition of PRO0386 (Accession NM_018562). Accordingly, utilities of

VGAM1038 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO0386. RAP140 (Accession NM_015224) is another VGAM1038 host target gene. RAP140 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RAP140, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAP140 BINDING SITE, designated SEQ ID:17556, to the nucleotide sequence of VGAM1038 RNA, herein designated VGAM RNA, also designated SEQ ID:3749.

[38163] Another function of VGAM1038 is therefore inhibition of RAP140 (Accession NM_015224). Accordingly, utilities of VGAM1038 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAP140. Serologically Defined Colon Cancer Antigen 3 (SDCCAG3, Accession NM_006643) is another VGAM1038 host target gene. SDCCAG3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SDCCAG3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of SDCCAG3 BINDING SITE, designated SEQ ID:13434, to the nucleotide sequence of VGAM1038 RNA, herein designated VGAM RNA, also designated SEQ ID:3749.

[38164] Another function of VGAM1038 is therefore inhibition of Serologically Defined Colon Cancer Antigen 3 (SDCCAG3, Accession NM_006643). Accordingly, utilities of VGAM1038 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SDCCAG3. LOC122769 (Accession XM_058657) is another VGAM1038 host target gene. LOC122769 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC122769, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC122769 BINDING SITE, designated SEQ ID:36694, to the nucleotide sequence of VGAM1038 RNA, herein designated VGAM RNA, also designated SEQ ID:3749.

[38165] Another function of VGAM1038 is therefore inhibition of LOC122769 (Accession XM_058657). Accordingly, utilities of VGAM1038 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC122769. LOC256901 (Accession XM_172952) is another VGAM1038 host target gene. LOC256901 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC256901, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256901 BINDING SITE, designated SEQ ID:46206, to the nucleotide sequence of VGAM1038 RNA, herein designated VGAM RNA, also designated SEQ ID:3749.

[38166] Another function of VGAM1038 is therefore inhibition of LOC256901 (Accession XM_172952). Accordingly, utilities of VGAM1038 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256901. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1039 (VGAM1039) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[38167] VGAM1039 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM1039 was detected is described hereinabove with reference to Figs. 1–8.

[38168] VGAM1039 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mollusum Contagiosum Virus. VGAM1039 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[38169] VGAM1039 gene encodes a VGAM1039 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1039 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1039 precursor RNA is designated SEQ ID:1025, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1025 is located at position 95607 relative to the genome of Mollusum Contagiosum Virus.

[38170] VGAM1039 precursor RNA folds onto itself, forming VGAM1039 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide

sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[38171] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1039 folded precursor RNA into VGAM1039 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 56%) nucleotide sequence of VGAM1039 RNA is designated SEQ ID:3750, and is provided hereinbelow with reference to the sequence listing part.

[38172] VGAM1039 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1039 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1039 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[38173] VGAM1039 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM1039 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1039 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1039 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1039 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[38174] The complementary binding of VGAM1039 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM1039 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1039 host target RNA into VGAM1039 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[38175] It is appreciated that VGAM1039 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1039 host target genes. The mRNA of each one of this plurality of VGAM1039 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1039 RNA, herein designated VGAM RNA, and which when bound by VGAM1039 RNA causes inhibition of translation of respective one or more VGAM1039 host target proteins.

[38176] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1039 gene, herein designated VGAM GENE, on one or more VGAM1039 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[38177] It is yet further appreciated that a function of VGAM1039 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1039 include diagnosis, prevention and treatment of viral infection by Molluscum Contagiosum Virus. Specific functions, and accordingly utilities, of VGAM1039 correlate with, and may be deduced from, the identity of the host target genes which VGAM1039 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[38178] Nucleotide sequences of the VGAM1039 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1039 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM1039 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1039 are further described hereinbelow with reference to Table 1.

[38179] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1039 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1039 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[38180] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1039 gene, herein designated VGAM is inhibition of expression of VGAM1039 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1039 correlate with, and may be deduced from, the identity of the target genes which VGAM1039 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[38181] A Disintegrin and Metalloproteinase Domain 12 (meltrin alpha) (ADAM12, Accession NM_003474) is a VGAM1039 host target gene. ADAM12 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA

encoded by ADAM12, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADAM12 BINDING SITE, designated SEQ ID:9544, to the nucleotide sequence of VGAM1039 RNA, herein designated VGAM RNA, also designated SEQ ID:3750.

[38182] A function of VGAM1039 is therefore inhibition of A Disintegrin and Metalloproteinase Domain 12 (meltrin alpha) (ADAM12, Accession NM_003474), a gene which involved in skeletal muscle regeneration, specifically at the onset of cell fusion. Accordingly, utilities of VGAM1039 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADAM12. The function of ADAM12 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM675.Cyclin-dependent Kinase Inhibitor 2A (melanoma, p16, inhibits CDK4) (CDKN2A, Accession NM_058197) is another VGAM1039 host target gene. CDKN2A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CDKN2A, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDKN2A BINDING SITE, designated SEQ ID:27758, to the nucleotide sequence of VGAM1039 RNA, herein designated VGAM RNA, also designated SEQ ID:3750.

[38183] Another function of VGAM1039 is therefore inhibition of Cyclin-dependent Kinase Inhibitor 2A (melanoma, p16, inhibits CDK4) (CDKN2A, Accession NM_058197). Accordingly, utilities of VGAM1039 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDKN2A. Cyclin-dependent Kinase Inhibitor 2B (p15, inhibits CDK4) (CDKN2B, Accession NM_078487) is another VGAM1039 host target gene. CDKN2B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CDKN2B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDKN2B BINDING SITE, designated SEQ ID:27808, to the nucleotide sequence of VGAM1039 RNA, herein designated VGAM RNA, also designated SEQ ID:3750.

[38184] Another function of VGAM1039 is therefore inhibition of

Cyclin-dependent Kinase Inhibitor 2B (p15, inhibits CDK4) (CDKN2B, Accession NM_078487). Accordingly, utilities of VGAM1039 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDKN2B. Cerebellin 1 Precursor (CBLN1, Accession NM_004352) is another VGAM1039 host target gene. CBLN1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CBLN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CBLN1 BINDING SITE, designated SEQ ID:10558, to the nucleotide sequence of VGAM1039 RNA, herein designated VGAM RNA, also designated SEQ ID:3750.

[38185] Another function of VGAM1039 is therefore inhibition of Cerebellin 1 Precursor (CBLN1, Accession NM_004352). Accordingly, utilities of VGAM1039 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CBLN1. KIAA1904 (Accession XM_056282) is another VGAM1039 host target gene. KIAA1904 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

KIAA1904, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1904 BINDING SITE, designated SEQ ID:36380, to the nucleotide sequence of VGAM1039 RNA, herein designated VGAM RNA, also designated SEQ ID:3750.

[38186] Another function of VGAM1039 is therefore inhibition of KIAA1904 (Accession XM_056282). Accordingly, utilities of VGAM1039 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1904. Retinoic Acid Induced 1 (RAI1, Accession XM_016259) is another VGAM1039 host target gene. RAI1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by RAI1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAI1 BINDING SITE, designated SEQ ID:30254, to the nucleotide sequence of VGAM1039 RNA, herein designated VGAM RNA, also designated SEQ ID:3750.

[38187] Another function of VGAM1039 is therefore inhibition of Retinoic Acid Induced 1 (RAI1, Accession XM_016259).

Accordingly, utilities of VGAM1039 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAI1. RINZF (Accession NM_023929) is another VGAM1039 host target gene. RINZF BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by RINZF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RINZF BINDING SITE, designated SEQ ID:23412, to the nucleotide sequence of VGAM1039 RNA, herein designated VGAM RNA, also designated SEQ ID:3750.

[38188] Another function of VGAM1039 is therefore inhibition of RINZF (Accession NM_023929). Accordingly, utilities of VGAM1039 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RINZF. SH3 and Multiple Ankyrin Repeat Domains 3 (SHANK3, Accession XM_037493) is another VGAM1039 host target gene. SHANK3 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by SHANK3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of SHANK3 BINDING SITE, designated SEQ ID:32635, to the nucleotide sequence of VGAM1039 RNA, herein designated VGAM RNA, also designated SEQ ID:3750.

[38189] Another function of VGAM1039 is therefore inhibition of SH3 and Multiple Ankyrin Repeat Domains 3 (SHANK3, Accession XM_037493). Accordingly, utilities of VGAM1039 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SHANK3.

LOC201292 (Accession XM_113949) is another VGAM1039 host target gene. LOC201292 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC201292, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201292 BINDING SITE, designated SEQ ID:42564, to the nucleotide sequence of VGAM1039 RNA, herein designated VGAM RNA, also designated SEQ ID:3750.

[38190] Another function of VGAM1039 is therefore inhibition of LOC201292 (Accession XM_113949). Accordingly, utilities of VGAM1039 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC201292. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1040 (VGAM1040) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[38191] VGAM1040 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1040 was detected is described hereinabove with reference to Figs. 1–8.

[38192] VGAM1040 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Molluscum Contagiosum Virus. VGAM1040 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[38193] VGAM1040 gene encodes a VGAM1040 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1040 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1040 precursor RNA is designated SEQ ID:1026, and is provided hereinbelow with ref–

erence to the sequence listing part. Nucleotide sequence SEQ ID:1026 is located at position 92882 relative to the genome of Molluscum Contagiosum Virus.

- [38194] VGAM1040 precursor RNA folds onto itself, forming VGAM1040 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [38195] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1040 folded precursor RNA into VGAM1040 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM1040 RNA is designated SEQ ID:3751, and is provided hereinbelow with reference to the sequence listing part.

[38196] VGAM1040 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1040 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1040 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[38197] VGAM1040 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1040 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1040 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1040 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM1040 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[38198] The complementary binding of VGAM1040 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1040 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1040 host target RNA into VGAM1040 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[38199] It is appreciated that VGAM1040 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1040 host target genes. The mRNA of each one of this plurality of VGAM1040 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1040 RNA, herein designated VGAM RNA, and which when bound by VGAM1040 RNA causes

inhibition of translation of respective one or more VGAM1040 host target proteins.

[38200] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1040 gene, herein designated VGAM GENE, on one or more VGAM1040 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[38201] It is yet further appreciated that a function of VGAM1040 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1040 include diagnosis, prevention and

treatment of viral infection by Mollusum Contagiosum Virus. Specific functions, and accordingly utilities, of VGAM1040 correlate with, and may be deduced from, the identity of the host target genes which VGAM1040 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[38202] Nucleotide sequences of the VGAM1040 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1040 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1040 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1040 are further described hereinbelow with reference to Table 1.

[38203] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1040 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1040 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[38204] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1040 gene, herein designated VGAM is inhibition of expression of VGAM1040 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM1040 correlate with, and may be deduced from, the identity of the target genes which VGAM1040 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[38205] Sodium Channel, Nonvoltage-gated 1 Alpha (SCNN1A, Accession NM_001038) is a VGAM1040 host target gene. SCNN1A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SCNN1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCNN1A BINDING SITE, designated SEQ ID:6702, to the nucleotide sequence of VGAM1040 RNA, herein designated VGAM RNA, also designated SEQ ID:3751.

[38206] A function of VGAM1040 is therefore inhibition of Sodium Channel, Nonvoltage-gated 1 Alpha (SCNN1A, Accession NM_001038). Accordingly, utilities of VGAM1040 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCNN1A. Degenerative Spermatocyte Homolog, Lipid Desaturase (Drosophila) (DEGS, Accession NM_003676) is another VGAM1040 host

target gene. DEGS BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DEGS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DEGS BINDING SITE, designated SEQ ID:9769, to the nucleotide sequence of VGAM1040 RNA, herein designated VGAM RNA, also designated SEQ ID:3751.

[38207] Another function of VGAM1040 is therefore inhibition of Degenerative Spermatocyte Homolog, Lipid Desaturase (Drosophila) (DEGS, Accession NM_003676). Accordingly, utilities of VGAM1040 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DEGS. KIAA0040 (Accession NM_014656) is another VGAM1040 host target gene. KIAA0040 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0040, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0040 BINDING SITE, designated SEQ ID:16099, to the nucleotide sequence of VGAM1040 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3751.

[38208] Another function of VGAM1040 is therefore inhibition of KIAA0040 (Accession NM_014656). Accordingly, utilities of VGAM1040 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0040. TNF Receptor-associated Factor 4 (TRAF4, Accession XM_031427) is another VGAM1040 host target gene. TRAF4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRAF4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRAF4 BINDING SITE, designated SEQ ID:31377, to the nucleotide sequence of VGAM1040 RNA, herein designated VGAM RNA, also designated SEQ ID:3751.

[38209] Another function of VGAM1040 is therefore inhibition of TNF Receptor-associated Factor 4 (TRAF4, Accession XM_031427). Accordingly, utilities of VGAM1040 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRAF4. LOC153196 (Accession XM_098323) is another VGAM1040 host target gene. LOC153196 BINDING SITE is HOST TARGET binding

site found in the 5' untranslated region of mRNA encoded by LOC153196, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153196 BINDING SITE, designated SEQ ID:41585, to the nucleotide sequence of VGAM1040 RNA, herein designated VGAM RNA, also designated SEQ ID:3751.

[38210] Another function of VGAM1040 is therefore inhibition of LOC153196 (Accession XM_098323). Accordingly, utilities of VGAM1040 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153196. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1041 (VGAM1041) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[38211] VGAM1041 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1041 was detected is described hereinabove with reference to Figs. 1-8.

[38212] VGAM1041 gene, herein designated VGAM GENE, is a viral gene contained in the genome of White Clover Mosaic Virus. VGAM1041 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[38213] VGAM1041 gene encodes a VGAM1041 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1041 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1041 precursor RNA is designated SEQ ID:1027, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1027 is located at position 1636 relative to the genome of White Clover Mosaic Virus.

[38214] VGAM1041 precursor RNA folds onto itself, forming VGAM1041 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence

of the nucleotide sequence of the second half thereof.

[38215] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1041 folded precursor RNA into VGAM1041 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1041 RNA is designated SEQ ID:3752, and is provided hereinbelow with reference to the sequence listing part.

[38216] VGAM1041 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1041 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1041 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[38217] VGAM1041 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1041 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1041 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1041 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1041 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[38218] The complementary binding of VGAM1041 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1041 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM1041 host target RNA into VGAM1041 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[38219] It is appreciated that VGAM1041 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1041 host target genes. The mRNA of each one of this plurality of VGAM1041 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1041 RNA, herein designated VGAM RNA, and which when bound by VGAM1041 RNA causes inhibition of translation of respective one or more VGAM1041 host target proteins.

[38220] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1041 gene, herein designated VGAM GENE, on one or more VGAM1041 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[38221] It is yet further appreciated that a function of VGAM1041 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1041 include diagnosis, prevention and treatment of viral infection by White Clover Mosaic Virus. Specific functions, and accordingly utilities, of VGAM1041 correlate with, and may be deduced from, the identity of the host target genes which VGAM1041 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[38222] Nucleotide sequences of the VGAM1041 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1041 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1041 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM1041 are further described hereinbelow with reference to Table 1.

[38223] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1041 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1041 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[38224] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1041 gene, herein designated VGAM is inhibition of expression of VGAM1041 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1041 correlate with, and may be deduced from, the identity of the target genes which VGAM1041 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[38225] Glucocorticoid Receptor DNA Binding Factor 1 (GRLF1, Accession XM_085943) is a VGAM1041 host target gene. GRLF1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GRLF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2

illustrates the complementarity of the nucleotide sequences of GRLF1 BINDING SITE, designated SEQ ID:38410, to the nucleotide sequence of VGAM1041 RNA, herein designated VGAM RNA, also designated SEQ ID:3752.

[38226] A function of VGAM1041 is therefore inhibition of Glucocorticoid Receptor DNA Binding Factor 1 (GRLF1, Accession XM_085943), a gene which inhibits transcription of the glucocorticoid receptor gene. Accordingly, utilities of VGAM1041 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GRLF1. The function of GRLF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM55.BA108L7.2 (Accession NM_030971) is another VGAM1041 host target gene. BA108L7.2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BA108L7.2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BA108L7.2 BINDING SITE, designated SEQ ID:25236, to the nucleotide sequence of VGAM1041 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3752.

[38227] Another function of VGAM1041 is therefore inhibition of BA108L7.2 (Accession NM_030971). Accordingly, utilities of VGAM1041 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BA108L7.2. CDT1 (Accession XM_085327) is another VGAM1041 host target gene. CDT1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by CDT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDT1 BINDING SITE, designated SEQ ID:38068, to the nucleotide sequence of VGAM1041 RNA, herein designated VGAM RNA, also designated SEQ ID:3752.

[38228] Another function of VGAM1041 is therefore inhibition of CDT1 (Accession XM_085327). Accordingly, utilities of VGAM1041 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDT1. KIAA0992 (Accession NM_016081) is another VGAM1041 host target gene. KIAA0992 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0992, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0992 BINDING SITE, designated SEQ ID:18155, to the nucleotide sequence of VGAM1041 RNA, herein designated VGAM RNA, also designated SEQ ID:3752.

[38229] Another function of VGAM1041 is therefore inhibition of KIAA0992 (Accession NM_016081). Accordingly, utilities of VGAM1041 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0992. KIAA1181 (Accession XM_043340) is another VGAM1041 host target gene. KIAA1181 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1181, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1181 BINDING SITE, designated SEQ ID:33922, to the nucleotide sequence of VGAM1041 RNA, herein designated VGAM RNA, also designated SEQ ID:3752.

[38230] Another function of VGAM1041 is therefore inhibition of KIAA1181 (Accession XM_043340). Accordingly, utilities of VGAM1041 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA1181. MIG (Accession NM_002416) is another VGAM1041 host target gene. MIG BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MIG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MIG BINDING SITE, designated SEQ ID:8242, to the nucleotide sequence of VGAM1041 RNA, herein designated VGAM RNA, also designated SEQ ID:3752.

[38231] Another function of VGAM1041 is therefore inhibition of MIG (Accession NM_002416). Accordingly, utilities of VGAM1041 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MIG. LOC196485 (Accession XM_113731) is another VGAM1041 host target gene. LOC196485 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC196485, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196485 BINDING SITE, designated SEQ ID:42380, to

the nucleotide sequence of VGAM1041 RNA, herein designated VGAM RNA, also designated SEQ ID:3752.

[38232] Another function of VGAM1041 is therefore inhibition of LOC196485 (Accession XM_113731). Accordingly, utilities of VGAM1041 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196485. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1042 (VGAM1042) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[38233] VGAM1042 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1042 was detected is described hereinabove with reference to Figs. 1–8.

[38234] VGAM1042 gene, herein designated VGAM GENE, is a viral gene contained in the genome of White Clover Mosaic Virus. VGAM1042 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[38235] VGAM1042 gene encodes a VGAM1042 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1042 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1042 precursor RNA is designated SEQ ID:1028, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1028 is located at position 3519 relative to the genome of White Clover Mosaic Virus.

[38236] VGAM1042 precursor RNA folds onto itself, forming VGAM1042 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[38237] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1042 folded precursor RNA into VGAM1042 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of VGAM1042 RNA is designated SEQ ID:3753, and is provided hereinbelow with reference to the sequence listing part.

[38238] VGAM1042 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1042 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1042 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[38239] VGAM1042 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1042 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1042 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1042 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1042 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[38240] The complementary binding of VGAM1042 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1042 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1042 host target RNA into VGAM1042 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[38241] It is appreciated that VGAM1042 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM1042 host target genes. The mRNA of each one of this plurality of VGAM1042 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1042 RNA, herein designated VGAM RNA, and which when bound by VGAM1042 RNA causes inhibition of translation of respective one or more VGAM1042 host target proteins.

[38242] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1042 gene, herein designated VGAM GENE, on one or more VGAM1042 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science
294,779 (2001)).

[38243] It is yet further appreciated that a function of VGAM1042 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1042 include diagnosis, prevention and treatment of viral infection by White Clover Mosaic Virus. Specific functions, and accordingly utilities, of VGAM1042 correlate with, and may be deduced from, the identity of the host target genes which VGAM1042 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[38244] Nucleotide sequences of the VGAM1042 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1042 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1042 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1042 are further described hereinbelow with reference to Table 1.

[38245] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1042 host target RNA, and schematic representation of the complementarity of each

of these host target binding sites to VGAM1042 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[38246] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1042 gene, herein designated VGAM is inhibition of expression of VGAM1042 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1042 correlate with, and may be deduced from, the identity of the target genes which VGAM1042 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[38247] Endothelin 2 (EDN2, Accession NM_001956) is a VGAM1042 host target gene. EDN2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EDN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EDN2 BINDING SITE, designated SEQ ID:7681, to the nucleotide sequence of VGAM1042 RNA, herein designated VGAM RNA, also designated SEQ ID:3753.

[38248] A function of VGAM1042 is therefore inhibition of Endothelin 2 (EDN2, Accession NM_001956), a gene which is

a precursor of the hormone endothelin 2 which is an endothelium-derived vasoconstrictor peptide. Accordingly, utilities of VGAM1042 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EDN2. The function of EDN2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1015. Centaurin, Gamma 2 (CENTG2, Accession NM_014914) is another VGAM1042 host target gene. CENTG2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CENTG2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CENTG2 BINDING SITE, designated SEQ ID:17156, to the nucleotide sequence of VGAM1042 RNA, herein designated VGAM RNA, also designated SEQ ID:3753.

[38249] Another function of VGAM1042 is therefore inhibition of Centaurin, Gamma 2 (CENTG2, Accession NM_014914). Accordingly, utilities of VGAM1042 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CENTG2. Carbohydrate

(N-acetylglucosamine 6-O) Sulfotransferase 4 (CHST4, Accession NM_005769) is another VGAM1042 host target gene. CHST4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CHST4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHST4 BINDING SITE, designated SEQ ID:12336, to the nucleotide sequence of VGAM1042 RNA, herein designated VGAM RNA, also designated SEQ ID:3753.

[38250] Another function of VGAM1042 is therefore inhibition of Carbohydrate (N-acetylglucosamine 6-O) Sulfotransferase 4 (CHST4, Accession NM_005769). Accordingly, utilities of VGAM1042 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHST4. KIAA1889 (Accession XM_056298) is another VGAM1042 host target gene. KIAA1889 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1889, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1889 BINDING SITE,

designated SEQ ID:36386, to the nucleotide sequence of VGAM1042 RNA, herein designated VGAM RNA, also designated SEQ ID:3753.

[38251] Another function of VGAM1042 is therefore inhibition of KIAA1889 (Accession XM_056298). Accordingly, utilities of VGAM1042 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1889. Ribosomal Protein S6 Kinase, 90kDa, Polypeptide 4 (RPS6KA4, Accession NM_003942) is another VGAM1042 host target gene. RPS6KA4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RPS6KA4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RPS6KA4 BINDING SITE, designated SEQ ID:10053, to the nucleotide sequence of VGAM1042 RNA, herein designated VGAM RNA, also designated SEQ ID:3753.

[38252] Another function of VGAM1042 is therefore inhibition of Ribosomal Protein S6 Kinase, 90kDa, Polypeptide 4 (RPS6KA4, Accession NM_003942). Accordingly, utilities of VGAM1042 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

RPS6KA4. LOC151719 (Accession XM_087280) is another VGAM1042 host target gene. LOC151719 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC151719, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151719 BINDING SITE, designated SEQ ID:39162, to the nucleotide sequence of VGAM1042 RNA, herein designated VGAM RNA, also designated SEQ ID:3753.

[38253] Another function of VGAM1042 is therefore inhibition of LOC151719 (Accession XM_087280). Accordingly, utilities of VGAM1042 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151719. LOC255040 (Accession XM_172837) is another VGAM1042 host target gene. LOC255040 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC255040, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255040 BINDING SITE, designated SEQ ID:46110, to the nucleotide sequence of VGAM1042 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3753.

[38254] Another function of VGAM1042 is therefore inhibition of LOC255040 (Accession XM_172837). Accordingly, utilities of VGAM1042 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255040. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1043 (VGAM1043) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[38255] VGAM1043 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1043 was detected is described hereinabove with reference to Figs. 1–8.

[38256] VGAM1043 gene, herein designated VGAM GENE, is a viral gene contained in the genome of White Clover Mosaic Virus. VGAM1043 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[38257] VGAM1043 gene encodes a VGAM1043 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM1043 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1043 precursor RNA is designated SEQ ID:1029, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1029 is located at position 5056 relative to the genome of White Clover Mosaic Virus.

[38258] VGAM1043 precursor RNA folds onto itself, forming VGAM1043 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[38259] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1043 folded precursor RNA into VGAM1043 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1043 RNA is designated SEQ ID:3754, and is provided hereinbelow with reference to the sequence listing part.

[38260] VGAM1043 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1043 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1043 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[38261] VGAM1043 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1043 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1043 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1043 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1043 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[38262] The complementary binding of VGAM1043 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1043 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1043 host target RNA into VGAM1043 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[38263] It is appreciated that VGAM1043 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1043 host target genes. The mRNA of

each one of this plurality of VGAM1043 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1043 RNA, herein designated VGAM RNA, and which when bound by VGAM1043 RNA causes inhibition of translation of respective one or more VGAM1043 host target proteins.

[38264] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1043 gene, herein designated VGAM GENE, on one or more VGAM1043 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[38265] It is yet further appreciated that a function of VGAM1043 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1043 include diagnosis, prevention and treatment of viral infection by White Clover Mosaic Virus. Specific functions, and accordingly utilities, of VGAM1043 correlate with, and may be deduced from, the identity of the host target genes which VGAM1043 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[38266] Nucleotide sequences of the VGAM1043 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1043 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1043 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1043 are further described hereinbelow with reference to Table 1.

[38267] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1043 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1043 RNA,

herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[38268] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1043 gene, herein designated VGAM is inhibition of expression of VGAM1043 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1043 correlate with, and may be deduced from, the identity of the target genes which VGAM1043 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[38269] Acyl-Coenzyme A Dehydrogenase, C-4 to C-12 Straight Chain (ACADM, Accession NM_000016) is a VGAM1043 host target gene. ACADM BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ACADM, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ACADM BINDING SITE, designated SEQ ID:5452, to the nucleotide sequence of VGAM1043 RNA, herein designated VGAM RNA, also designated SEQ ID:3754.

[38270] A function of VGAM1043 is therefore inhibition of Acyl-Coenzyme A Dehydrogenase, C-4 to C-12 Straight Chain

(ACADM, Accession NM_000016). Accordingly, utilities of VGAM1043 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ACADM. Adenylate Cyclase 9 (ADCY9, Accession NM_001116) is another VGAM1043 host target gene. ADCY9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ADCY9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADCY9 BINDING SITE, designated SEQ ID:6790, to the nucleotide sequence of VGAM1043 RNA, herein designated VGAM RNA, also designated SEQ ID:3754.

[38271] Another function of VGAM1043 is therefore inhibition of Adenylate Cyclase 9 (ADCY9, Accession NM_001116), a gene which . may be a physiologically relevant docking site for calcineurin (by similarity). Accordingly, utilities of VGAM1043 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADCY9. The function of ADCY9 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference

to VGAM477.ADP-ribosylation Factor 1 (ARF1, Accession XM_047545) is another VGAM1043 host target gene. ARF1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ARF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARF1 BINDING SITE, designated SEQ ID:34991, to the nucleotide sequence of VGAM1043 RNA, herein designated VGAM RNA, also designated SEQ ID:3754.

[38272] Another function of VGAM1043 is therefore inhibition of ADP-ribosylation Factor 1 (ARF1, Accession XM_047545). Accordingly, utilities of VGAM1043 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARF1. ATPase, Na⁺/K⁺ Transporting, Alpha 2 (+) Polypeptide (ATP1A2, Accession NM_000702) is another VGAM1043 host target gene. ATP1A2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ATP1A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP1A2 BINDING SITE, designated SEQ

ID:6368, to the nucleotide sequence of VGAM1043 RNA, herein designated VGAM RNA, also designated SEQ ID:3754.

[38273] Another function of VGAM1043 is therefore inhibition of ATPase, Na⁺/K⁺ Transporting, Alpha 2 (+) Polypeptide (ATP1A2, Accession NM_000702). Accordingly, utilities of VGAM1043 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP1A2. Collagen, Type XV, Alpha 1 (COL15A1, Accession NM_001855) is another VGAM1043 host target gene. COL15A1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by COL15A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COL15A1 BINDING SITE, designated SEQ ID:7588, to the nucleotide sequence of VGAM1043 RNA, herein designated VGAM RNA, also designated SEQ ID:3754.

[38274] Another function of VGAM1043 is therefore inhibition of Collagen, Type XV, Alpha 1 (COL15A1, Accession NM_001855), a gene which may be involved in maintaining the structure of connective tissue. Accordingly, utili-

ties of VGAM1043 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COL15A1. The function of COL15A1 and its association with various diseases and clinical conditions, has been established by previous studies, as described herein above with reference to VGAM304. Casein Kinase 1, Gamma 3 (CSNK1G3, Accession NM_004384) is another VGAM1043 host target gene. CSNK1G3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CSNK1G3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CSNK1G3 BINDING SITE, designated SEQ ID:10609, to the nucleotide sequence of VGAM1043 RNA, herein designated VGAM RNA, also designated SEQ ID:3754.

[38275] Another function of VGAM1043 is therefore inhibition of Casein Kinase 1, Gamma 3 (CSNK1G3, Accession NM_004384). Accordingly, utilities of VGAM1043 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CSNK1G3. Chemokine (C-X3-C motif) Receptor 1 (CX3CR1, Accession XM_047502) is another VGAM1043 host target gene.

CX3CR1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CX3CR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CX3CR1 BINDING SITE, designated SEQ ID:34974, to the nucleotide sequence of VGAM1043 RNA, herein designated VGAM RNA, also designated SEQ ID:3754.

[38276] Another function of VGAM1043 is therefore inhibition of Chemokine (C-X3-C motif) Receptor 1 (CX3CR1, Accession XM_047502), a gene which mediates both the adhesive and migratory functions of fractalkine. Accordingly, utilities of VGAM1043 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CX3CR1. The function of CX3CR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM25.DNA (cytosine-5-methyltransferase 2 (DNMT2, Accession NM_004412) is another VGAM1043 host target gene. DNMT2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

DNMT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DNMT2 BINDING SITE, designated SEQ ID:10670, to the nucleotide sequence of VGAM1043 RNA, herein designated VGAM RNA, also designated SEQ ID:3754.

[38277] Another function of VGAM1043 is therefore inhibition of DNA (cytosine-5-)-methyltransferase 2 (DNMT2, Accession NM_004412), a gene which may mark specific sequences in the genome . Accordingly, utilities of VGAM1043 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DNMT2. The function of DNMT2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM177.Desmocollin 3 (DSC3, Accession NM_024423) is another VGAM1043 host target gene. DSC3 BINDING SITE1 and DSC3 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by DSC3, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of DSC3 BINDING SITE1 and DSC3 BINDING SITE2, designated SEQ ID:23664 and SEQ ID:7653 respectively, to the nucleotide sequence of VGAM1043 RNA, herein designated VGAM RNA, also designated SEQ ID:3754.

[38278] Another function of VGAM1043 is therefore inhibition of Desmocollin 3 (DSC3, Accession NM_024423), a gene which is a component of intercellular desmosome junctions. Accordingly, utilities of VGAM1043 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DSC3. The function of DSC3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM230. Down Syndrome Critical Region Gene 3 (DSCR3, Accession NM_006052) is another VGAM1043 host target gene. DSCR3 BINDING SITE1 and DSCR3 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by DSCR3, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DSCR3 BINDING SITE1 and DSCR3 BINDING SITE2, designated SEQ ID:12686 and

SEQ ID:11722 respectively, to the nucleotide sequence of VGAM1043 RNA, herein designated VGAM RNA, also designated SEQ ID:3754.

[38279] Another function of VGAM1043 is therefore inhibition of Down Syndrome Critical Region Gene 3 (DSCR3, Accession NM_006052). Accordingly, utilities of VGAM1043 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DSCR3. UDP-N-acetyl-alpha-D-galactosamine:polypeptide N-acetylgalactosaminyltransferase 7 (GalNAc-T7) (GALNT7, Accession NM_017423) is another VGAM1043 host target gene. GALNT7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GALNT7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GALNT7 BINDING SITE, designated SEQ ID:18877, to the nucleotide sequence of VGAM1043 RNA, herein designated VGAM RNA, also designated SEQ ID:3754.

[38280] Another function of VGAM1043 is therefore inhibition of UDP-N-acetyl-alpha-D-galactosamine:polypeptide N-acetylgalactosaminyltransferase 7 (GalNAc-T7) (GALNT7,

Accession NM_017423). Accordingly, utilities of VGAM1043 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GALNT7. Integral Membrane Protein 2B (ITM2B, Accession NM_021999) is another VGAM1043 host target gene. ITM2B BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ITM2B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITM2B BINDING SITE, designated SEQ ID:22540, to the nucleotide sequence of VGAM1043 RNA, herein designated VGAM RNA, also designated SEQ ID:3754.

[38281] Another function of VGAM1043 is therefore inhibition of Integral Membrane Protein 2B (ITM2B, Accession NM_021999), a gene which is a member of the type II integral membrane protein family. Accordingly, utilities of VGAM1043 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITM2B. The function of ITM2B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference

to VGAM458.Kinesin Family Member 3C (KIF3C, Accession NM_002254) is another VGAM1043 host target gene. KIF3C BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIF3C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIF3C BINDING SITE, designated SEQ ID:8058, to the nucleotide sequence of VGAM1043 RNA, herein designated VGAM RNA, also designated SEQ ID:3754.

[38282] Another function of VGAM1043 is therefore inhibition of Kinesin Family Member 3C (KIF3C, Accession NM_002254). Accordingly, utilities of VGAM1043 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIF3C. Latent Transforming Growth Factor Beta Binding Protein 1 (LTBP1, Accession NM_000627) is another VGAM1043 host target gene. LTBP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LTBP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LTBP1 BINDING SITE, designated SEQ ID:6243,

to the nucleotide sequence of VGAM1043 RNA, herein designated VGAM RNA, also designated SEQ ID:3754.

[38283] Another function of VGAM1043 is therefore inhibition of Latent Transforming Growth Factor Beta Binding Protein 1 (LTBP1, Accession NM_000627), a gene which is involved in assembly and secretion of latent TGF-beta. Accordingly, utilities of VGAM1043 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LTBP1. The function of LTBP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM80. Meningioma (disrupted in balanced translocation) 1 (MN1, Accession NM_002430) is another VGAM1043 host target gene. MN1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MN1 BINDING SITE, designated SEQ ID:8275, to the nucleotide sequence of VGAM1043 RNA, herein designated VGAM RNA, also designated SEQ ID:3754.

[38284] Another function of VGAM1043 is therefore inhibition of

Meningioma (disrupted in balanced translocation) 1 (MN1, Accession NM_002430). Accordingly, utilities of VGAM1043 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MN1. RNA Binding Motif Protein, X Chromosome (RBMX, Accession XM_042968) is another VGAM1043 host target gene. RBMX BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RBMX, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RBMX BINDING SITE, designated SEQ ID:33857, to the nucleotide sequence of VGAM1043 RNA, herein designated VGAM RNA, also designated SEQ ID:3754.

[38285] Another function of VGAM1043 is therefore inhibition of RNA Binding Motif Protein, X Chromosome (RBMX, Accession XM_042968), a gene which binds rna as a component of the ribonucleosome. Accordingly, utilities of VGAM1043 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RBMX. The function of RBMX has been established by previous studies. The genes on the human Y chromosome fall into 2 classes with distinct evolutionary origins. Widely ex-

pressed, single-copy genes with X homologs that escape inactivation (X-Y shared genes) derive from the ancient proto X-Y chromosome pair. Testis-specific, multicopy genes with no X homologs originate from autosomes and have accumulated on a 'selfish Y' because of their male-specific function. Copies of genes in the RBMY gene family (see OMIM Ref. No. RBMY1A1, 400006) are candidate spermatogenesis genes because they are found in all 3 azoospermia factor (AZF) deletion intervals on the human Yq, which are associated with oligospermia or azoospermia (Vogt et al., 1997). An active X-borne homolog of the Y-borne RBMY gene was demonstrated in humans and marsupials by Delbridge et al. (1999) and in the mouse by Mazeyrat et al. (1999). Delbridge et al. (1999) stated that, like other gene pairs on the X and Y chromosomes (e.g., OMIM Ref. No. 400005), RBMX retained a widespread function and RBMY evolved a male-specific function in spermatogenesis. Thus, RBMY1A1, far from belonging to a 'second class' of testis-specific elements, is a diverged X-Y shared gene. Venables et al. (2000) used a yeast 2-hybrid system to show that the RBMY gene product hnRNP G and a novel testis-specific relative (termed hnRNP G-T) interact with Tra2-beta (OMIM Ref. No. 602719), an

activator of pre-mRNA splicing that is ubiquitous but highly expressed in testis. The RBMY gene product and Tra2-beta colocalized in 2 major domains in human spermatocyte nuclei. Incubation with the protein interaction domain of the RBMY gene product inhibited splicing in vitro of a specific pre-mRNA substrate containing an essential enhancer bound by Tra2-beta. The RNA-binding domain of RBM affected 5-prime splice site selection. The authors concluded that the hnRNP G family of proteins is involved in pre-mRNA splicing and hypothesized that RBM may be involved in Tra2-beta-dependent splicing in spermatocytes.

[38286] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[38287] Delbridge, M. L.; Lingenfelter, P. A.; Disteche, C. M.; Marshall Graves, J. A. : The candidate spermatogenesis gene RBMY has a homologue on the human X chromosome. (Letter) Nature Genet. 22: 223-224, 1999. ; and

[38288] Venables, J. P.; Elliott, D. J.; Makarova, O. V.; Makarov, E. M.; Cooke, H. J.; Eperon, I. C. : RBMY, a probable human spermatogenesis factor, and other hnRNP G proteins interact with T.

[38289] Further studies establishing the function and utilities of RBMX are found in John Hopkins OMIM database record ID 300199, and in cited publications numbered 11402–11406 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Thy-1 Cell Surface Antigen (THY1, Accession NM_006288) is another VGAM1043 host target gene. THY1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by THY1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of THY1 BINDING SITE, designated SEQ ID:12977, to the nucleotide sequence of VGAM1043 RNA, herein designated VGAM RNA, also designated SEQ ID:3754.

[38290] Another function of VGAM1043 is therefore inhibition of Thy-1 Cell Surface Antigen (THY1, Accession NM_006288), a gene which plays a role in cell-cell or cell-ligand interactions during synaptogenesis. Accordingly, utilities of VGAM1043 include diagnosis, prevention and treatment of diseases and clinical conditions associated with THY1. The function of THY1 and its association with various diseases and clinical conditions, has been estab-

lished by previous studies, as described hereinabove with reference to VGAM396. Activating Transcription Factor 3 (ATF3, Accession NM_004024) is another VGAM1043 host target gene. ATF3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ATF3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATF3 BINDING SITE, designated SEQ ID:10245, to the nucleotide sequence of VGAM1043 RNA, herein designated VGAM RNA, also designated SEQ ID:3754.

[38291] Another function of VGAM1043 is therefore inhibition of Activating Transcription Factor 3 (ATF3, Accession NM_004024). Accordingly, utilities of VGAM1043 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATF3. ATPase, Class V, Type 10D (ATP10D, Accession XM_054907) is another VGAM1043 host target gene. ATP10D BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ATP10D, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of ATP10D BINDING SITE, designated SEQ ID:36201, to the nucleotide sequence of VGAM1043 RNA, herein designated VGAM RNA, also designated SEQ ID:3754.

[38292] Another function of VGAM1043 is therefore inhibition of ATPase, Class V, Type 10D (ATP10D, Accession XM_054907). Accordingly, utilities of VGAM1043 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP10D. BA108L7.2 (Accession NM_030971) is another VGAM1043 host target gene. BA108L7.2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BA108L7.2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BA108L7.2 BINDING SITE, designated SEQ ID:25240, to the nucleotide sequence of VGAM1043 RNA, herein designated VGAM RNA, also designated SEQ ID:3754.

[38293] Another function of VGAM1043 is therefore inhibition of BA108L7.2 (Accession NM_030971). Accordingly, utilities of VGAM1043 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

BA108L7.2. Chromosome 15 Open Reading Frame 5 (C15orf5, Accession NM_030944) is another VGAM1043 host target gene. C15orf5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C15orf5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C15orf5 BINDING SITE, designated SEQ ID:25214, to the nucleotide sequence of VGAM1043 RNA, herein designated VGAM RNA, also designated SEQ ID:3754.

[38294] Another function of VGAM1043 is therefore inhibition of Chromosome 15 Open Reading Frame 5 (C15orf5, Accession NM_030944). Accordingly, utilities of VGAM1043 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C15orf5. Cat Eye Syndrome Chromosome Region, Candidate 1 (CECR1, Accession NM_017424) is another VGAM1043 host target gene. CECR1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CECR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-

quences of CECR1 BINDING SITE, designated SEQ ID:18883, to the nucleotide sequence of VGAM1043 RNA, herein designated VGAM RNA, also designated SEQ ID:3754.

[38295] Another function of VGAM1043 is therefore inhibition of Cat Eye Syndrome Chromosome Region, Candidate 1 (CECR1, Accession NM_017424). Accordingly, utilities of VGAM1043 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CECR1. Centaurin, Alpha 2 (CENTA2, Accession NM_018404) is another VGAM1043 host target gene. CENTA2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CENTA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CENTA2 BINDING SITE, designated SEQ ID:20443, to the nucleotide sequence of VGAM1043 RNA, herein designated VGAM RNA, also designated SEQ ID:3754.

[38296] Another function of VGAM1043 is therefore inhibition of Centaurin, Alpha 2 (CENTA2, Accession NM_018404). Accordingly, utilities of VGAM1043 include diagnosis, prevention and treatment of diseases and clinical conditions

associated with CENTA2. CGG Triplet Repeat Binding Protein 1 (CGGBP1, Accession NM_003663) is another VGAM1043 host target gene. CGGBP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CGGBP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CGGBP1 BINDING SITE, designated SEQ ID:9740, to the nucleotide sequence of VGAM1043 RNA, herein designated VGAM RNA, also designated SEQ ID:3754.

[38297] Another function of VGAM1043 is therefore inhibition of CGG Triplet Repeat Binding Protein 1 (CGGBP1, Accession NM_003663). Accordingly, utilities of VGAM1043 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CGGBP1. DKFZP434P211 (Accession NM_014549) is another VGAM1043 host target gene. DKFZP434P211 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP434P211, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434P211 BINDING

SITE, designated SEQ ID:15868, to the nucleotide sequence of VGAM1043 RNA, herein designated VGAM RNA, also designated SEQ ID:3754.

[38298] Another function of VGAM1043 is therefore inhibition of DKFZP434P211 (Accession NM_014549). Accordingly, utilities of VGAM1043 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434P211. DKFZP547N043 (Accession NM_032018) is another VGAM1043 host target gene. DKFZP547N043 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP547N043, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP547N043 BINDING SITE, designated SEQ ID:25731, to the nucleotide sequence of VGAM1043 RNA, herein designated VGAM RNA, also designated SEQ ID:3754.

[38299] Another function of VGAM1043 is therefore inhibition of DKFZP547N043 (Accession NM_032018). Accordingly, utilities of VGAM1043 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP547N043. DKFZP564M182 (Accession

XM_085525) is another VGAM1043 host target gene. DKFZP564M182 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP564M182, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564M182 BINDING SITE, designated SEQ ID:38219, to the nucleotide sequence of VGAM1043 RNA, herein designated VGAM RNA, also designated SEQ ID:3754.

[38300] Another function of VGAM1043 is therefore inhibition of DKFZP564M182 (Accession XM_085525). Accordingly, utilities of VGAM1043 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564M182. Cyclin D Binding Myb-like Transcription Factor 1 (DMTF1, Accession NM_021145) is another VGAM1043 host target gene. DMTF1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DMTF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DMTF1 BINDING SITE, designated SEQ ID:22116, to the nucleotide se-

quence of VGAM1043 RNA, herein designated VGAM RNA, also designated SEQ ID:3754.

[38301] Another function of VGAM1043 is therefore inhibition of Cyclin D Binding Myb-like Transcription Factor 1 (DMTF1, Accession NM_021145). Accordingly, utilities of VGAM1043 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DMTF1. FBP17 (Accession XM_052666) is another VGAM1043 host target gene. FBP17 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FBP17, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FBP17 BINDING SITE, designated SEQ ID:36049, to the nucleotide sequence of VGAM1043 RNA, herein designated VGAM RNA, also designated SEQ ID:3754.

[38302] Another function of VGAM1043 is therefore inhibition of FBP17 (Accession XM_052666). Accordingly, utilities of VGAM1043 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FBP17. FLJ10392 (Accession NM_018084) is another VGAM1043 host target gene. FLJ10392 BINDING SITE is HOST TARGET

binding site found in the 5` untranslated region of mRNA encoded by FLJ10392, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10392 BINDING SITE, designated SEQ ID:19846, to the nucleotide sequence of VGAM1043 RNA, herein designated VGAM RNA, also designated SEQ ID:3754.

[38303] Another function of VGAM1043 is therefore inhibition of FLJ10392 (Accession NM_018084). Accordingly, utilities of VGAM1043 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10392. FLJ10898 (Accession XM_002486) is another VGAM1043 host target gene. FLJ10898 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ10898, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10898 BINDING SITE, designated SEQ ID:29893, to the nucleotide sequence of VGAM1043 RNA, herein designated VGAM RNA, also designated SEQ ID:3754.

[38304] Another function of VGAM1043 is therefore inhibition of

FLJ10898 (Accession XM_002486). Accordingly, utilities of VGAM1043 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10898. FLJ11106 (Accession NM_018324) is another VGAM1043 host target gene. FLJ11106 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ11106, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11106 BINDING SITE, designated SEQ ID:20318, to the nucleotide sequence of VGAM1043 RNA, herein designated VGAM RNA, also designated SEQ ID:3754.

[38305] Another function of VGAM1043 is therefore inhibition of FLJ11106 (Accession NM_018324). Accordingly, utilities of VGAM1043 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11106. FLJ14166 (Accession NM_024565) is another VGAM1043 host target gene. FLJ14166 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14166, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of FLJ14166 BINDING SITE, designated SEQ ID:23792, to the nucleotide sequence of VGAM1043 RNA, herein designated VGAM RNA, also designated SEQ ID:3754.

[38306] Another function of VGAM1043 is therefore inhibition of FLJ14166 (Accession NM_024565). Accordingly, utilities of VGAM1043 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14166. FLJ20170 (Accession NM_017696) is another VGAM1043 host target gene. FLJ20170 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20170, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20170 BINDING SITE, designated SEQ ID:19259, to the nucleotide sequence of VGAM1043 RNA, herein designated VGAM RNA, also designated SEQ ID:3754.

[38307] Another function of VGAM1043 is therefore inhibition of FLJ20170 (Accession NM_017696). Accordingly, utilities of VGAM1043 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20170. FLJ22690 (Accession NM_024711) is another

VGAM1043 host target gene. FLJ22690 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22690, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22690 BINDING SITE, designated SEQ ID:24038, to the nucleotide sequence of VGAM1043 RNA, herein designated VGAM RNA, also designated SEQ ID:3754.

[38308] Another function of VGAM1043 is therefore inhibition of FLJ22690 (Accession NM_024711). Accordingly, utilities of VGAM1043 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22690. GLP (Accession NM_018652) is another VGAM1043 host target gene. GLP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GLP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GLP BINDING SITE, designated SEQ ID:20723, to the nucleotide sequence of VGAM1043 RNA, herein designated VGAM RNA, also designated SEQ ID:3754.

[38309] Another function of VGAM1043 is therefore inhibition of GLP (Accession NM_018652). Accordingly, utilities of VGAM1043 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GLP. GOLGIN-67 (Accession XM_170772) is another VGAM1043 host target gene. GOLGIN-67 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GOLGIN-67, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GOLGIN-67 BINDING SITE, designated SEQ ID:45536, to the nucleotide sequence of VGAM1043 RNA, herein designated VGAM RNA, also designated SEQ ID:3754.

[38310] Another function of VGAM1043 is therefore inhibition of GOLGIN-67 (Accession XM_170772). Accordingly, utilities of VGAM1043 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GOLGIN-67. Interleukin 17D (IL17D, Accession NM_138284) is another VGAM1043 host target gene. IL17D BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IL17D, corresponding to a HOST TARGET binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL17D BINDING SITE, designated SEQ ID:28699, to the nucleotide sequence of VGAM1043 RNA, herein designated VGAM RNA, also designated SEQ ID:3754.

[38311] Another function of VGAM1043 is therefore inhibition of Interleukin 17D (IL17D, Accession NM_138284). Accordingly, utilities of VGAM1043 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL17D. KIAA0152 (Accession NM_014730) is another VGAM1043 host target gene. KIAA0152 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0152, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0152 BINDING SITE, designated SEQ ID:16337, to the nucleotide sequence of VGAM1043 RNA, herein designated VGAM RNA, also designated SEQ ID:3754.

[38312] Another function of VGAM1043 is therefore inhibition of KIAA0152 (Accession NM_014730). Accordingly, utilities of VGAM1043 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA0152. KIAA0193 (Accession NM_014766) is another VGAM1043 host target gene. KIAA0193 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0193, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0193 BINDING SITE, designated SEQ ID:16538, to the nucleotide sequence of VGAM1043 RNA, herein designated VGAM RNA, also designated SEQ ID:3754.

[38313] Another function of VGAM1043 is therefore inhibition of KIAA0193 (Accession NM_014766). Accordingly, utilities of VGAM1043 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0193. KIAA0254 (Accession NM_014758) is another VGAM1043 host target gene. KIAA0254 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0254, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0254 BINDING SITE, designated SEQ ID:16503, to the nucleotide sequence of VGAM1043 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3754.

[38314] Another function of VGAM1043 is therefore inhibition of KIAA0254 (Accession NM_014758). Accordingly, utilities of VGAM1043 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0254. KIAA0379 (Accession XM_042860) is another VGAM1043 host target gene. KIAA0379 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0379, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0379 BINDING SITE, designated SEQ ID:33812, to the nucleotide sequence of VGAM1043 RNA, herein designated VGAM RNA, also designated SEQ ID:3754.

[38315] Another function of VGAM1043 is therefore inhibition of KIAA0379 (Accession XM_042860). Accordingly, utilities of VGAM1043 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0379. KIAA0603 (Accession NM_014832) is another VGAM1043 host target gene. KIAA0603 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0603, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0603 BINDING SITE, designated SEQ ID:16829, to the nucleotide sequence of VGAM1043 RNA, herein designated VGAM RNA, also designated SEQ ID:3754.

[38316] Another function of VGAM1043 is therefore inhibition of KIAA0603 (Accession NM_014832). Accordingly, utilities of VGAM1043 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0603. KIAA0620 (Accession XM_030707) is another VGAM1043 host target gene. KIAA0620 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0620, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0620 BINDING SITE, designated SEQ ID:31122, to the nucleotide sequence of VGAM1043 RNA, herein designated VGAM RNA, also designated SEQ ID:3754.

[38317] Another function of VGAM1043 is therefore inhibition of KIAA0620 (Accession XM_030707). Accordingly, utilities of VGAM1043 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA0620. KIAA0855 (Accession NM_015003) is another VGAM1043 host target gene. KIAA0855 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0855, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0855 BINDING SITE, designated SEQ ID:17376, to the nucleotide sequence of VGAM1043 RNA, herein designated VGAM RNA, also designated SEQ ID:3754.

[38318] Another function of VGAM1043 is therefore inhibition of KIAA0855 (Accession NM_015003). Accordingly, utilities of VGAM1043 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0855. KIAA0976 (Accession NM_014917) is another VGAM1043 host target gene. KIAA0976 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0976, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0976 BINDING SITE, designated SEQ ID:17167, to the

nucleotide sequence of VGAM1043 RNA, herein designated VGAM RNA, also designated SEQ ID:3754.

[38319] Another function of VGAM1043 is therefore inhibition of KIAA0976 (Accession NM_014917). Accordingly, utilities of VGAM1043 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0976. KIAA1170 (Accession XM_045907) is another VGAM1043 host target gene. KIAA1170 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1170, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1170 BINDING SITE, designated SEQ ID:34611, to the nucleotide sequence of VGAM1043 RNA, herein designated VGAM RNA, also designated SEQ ID:3754.

[38320] Another function of VGAM1043 is therefore inhibition of KIAA1170 (Accession XM_045907). Accordingly, utilities of VGAM1043 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1170. KIAA1361 (Accession XM_030845) is another VGAM1043 host target gene. KIAA1361 BINDING SITE is HOST TARGET binding site found in the 5' untranslated

region of mRNA encoded by KIAA1361, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1361 BINDING SITE, designated SEQ ID:31165, to the nucleotide sequence of VGAM1043 RNA, herein designated VGAM RNA, also designated SEQ ID:3754.

[38321] Another function of VGAM1043 is therefore inhibition of KIAA1361 (Accession XM_030845). Accordingly, utilities of VGAM1043 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1361. KIAA1789 (Accession XM_040486) is another VGAM1043 host target gene. KIAA1789 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1789, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1789 BINDING SITE, designated SEQ ID:33311, to the nucleotide sequence of VGAM1043 RNA, herein designated VGAM RNA, also designated SEQ ID:3754.

[38322] Another function of VGAM1043 is therefore inhibition of KIAA1789 (Accession XM_040486). Accordingly, utilities

of VGAM1043 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1789. KIAA1900 (Accession XM_055299) is another VGAM1043 host target gene. KIAA1900 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1900, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1900 BINDING SITE, designated SEQ ID:36260, to the nucleotide sequence of VGAM1043 RNA, herein designated VGAM RNA, also designated SEQ ID:3754.

[38323] Another function of VGAM1043 is therefore inhibition of KIAA1900 (Accession XM_055299). Accordingly, utilities of VGAM1043 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1900. MGC10940 (Accession NM_032303) is another VGAM1043 host target gene. MGC10940 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC10940, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

MGC10940 BINDING SITE, designated SEQ ID:26085, to the nucleotide sequence of VGAM1043 RNA, herein designated VGAM RNA, also designated SEQ ID:3754.

[38324] Another function of VGAM1043 is therefore inhibition of MGC10940 (Accession NM_032303). Accordingly, utilities of VGAM1043 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC10940. MGC10977 (Accession NM_032681) is another VGAM1043 host target gene. MGC10977 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC10977, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC10977 BINDING SITE, designated SEQ ID:26402, to the nucleotide sequence of VGAM1043 RNA, herein designated VGAM RNA, also designated SEQ ID:3754.

[38325] Another function of VGAM1043 is therefore inhibition of MGC10977 (Accession NM_032681). Accordingly, utilities of VGAM1043 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC10977. MGC12538 (Accession NM_032746) is another VGAM1043 host target gene. MGC12538 BINDING

SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MGC12538, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC12538 BINDING SITE, designated SEQ ID:26480, to the nucleotide sequence of VGAM1043 RNA, herein designated VGAM RNA, also designated SEQ ID:3754.

[38326] Another function of VGAM1043 is therefore inhibition of MGC12538 (Accession NM_032746). Accordingly, utilities of VGAM1043 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC12538. mPA-PLA1 (Accession NM_139248) is another VGAM1043 host target gene. mPA-PLA1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by mPA-PLA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of mPA-PLA1 BINDING SITE, designated SEQ ID:29252, to the nucleotide sequence of VGAM1043 RNA, herein designated VGAM RNA, also designated SEQ ID:3754.

[38327] Another function of VGAM1043 is therefore inhibition of

mPA-PLA1 (Accession NM_139248). Accordingly, utilities of VGAM1043 include diagnosis, prevention and treatment of diseases and clinical conditions associated with mPA-PLA1. Nudix (nucleoside diphosphate linked moiety X)-type Motif 12 (NUDT12, Accession NM_031438) is another VGAM1043 host target gene. NUDT12 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NUDT12, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NUDT12 BINDING SITE, designated SEQ ID:25449, to the nucleotide sequence of VGAM1043 RNA, herein designated VGAM RNA, also designated SEQ ID:3754.

[38328] Another function of VGAM1043 is therefore inhibition of Nudix (nucleoside diphosphate linked moiety X)-type Motif 12 (NUDT12, Accession NM_031438). Accordingly, utilities of VGAM1043 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NUDT12. PB1 (Accession NM_018165) is another VGAM1043 host target gene. PB1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PB1, corresponding to a HOST TAR-

GET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PB1 BINDING SITE, designated SEQ ID:19980, to the nucleotide sequence of VGAM1043 RNA, herein designated VGAM RNA, also designated SEQ ID:3754.

[38329] Another function of VGAM1043 is therefore inhibition of PB1 (Accession NM_018165). Accordingly, utilities of VGAM1043 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PB1. SDF1 (Accession XM_165565) is another VGAM1043 host target gene. SDF1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SDF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SDF1 BINDING SITE, designated SEQ ID:43690, to the nucleotide sequence of VGAM1043 RNA, herein designated VGAM RNA, also designated SEQ ID:3754.

[38330] Another function of VGAM1043 is therefore inhibition of SDF1 (Accession XM_165565). Accordingly, utilities of VGAM1043 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with SDF1. STI2 (Accession XM_114335) is another VGAM1043 host target gene. STI2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by STI2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STI2 BINDING SITE, designated SEQ ID:42877, to the nucleotide sequence of VGAM1043 RNA, herein designated VGAM RNA, also designated SEQ ID:3754.

[38331] Another function of VGAM1043 is therefore inhibition of STI2 (Accession XM_114335). Accordingly, utilities of VGAM1043 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STI2. Tripartite Motif-containing 26 (TRIM26, Accession NM_003449) is another VGAM1043 host target gene. TRIM26 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TRIM26, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRIM26 BINDING SITE, designated SEQ

ID:9501, to the nucleotide sequence of VGAM1043 RNA, herein designated VGAM RNA, also designated SEQ ID:3754.

[38332] Another function of VGAM1043 is therefore inhibition of Tripartite Motif-containing 26 (TRIM26, Accession NM_003449). Accordingly, utilities of VGAM1043 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIM26. Ubiquitin Specific Protease 8 (USP8, Accession NM_005154) is another VGAM1043 host target gene. USP8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by USP8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of USP8 BINDING SITE, designated SEQ ID:11628, to the nucleotide sequence of VGAM1043 RNA, herein designated VGAM RNA, also designated SEQ ID:3754.

[38333] Another function of VGAM1043 is therefore inhibition of Ubiquitin Specific Protease 8 (USP8, Accession NM_005154). Accordingly, utilities of VGAM1043 include diagnosis, prevention and treatment of diseases and clinical conditions associated with USP8. LOC115131

(Accession NM_145242) is another VGAM1043 host target gene. LOC115131 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC115131, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC115131 BINDING SITE, designated SEQ ID:29756, to the nucleotide sequence of VGAM1043 RNA, herein designated VGAM RNA, also designated SEQ ID:3754.

[38334] Another function of VGAM1043 is therefore inhibition of LOC115131 (Accession NM_145242). Accordingly, utilities of VGAM1043 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115131. LOC116236 (Accession XM_057674) is another VGAM1043 host target gene. LOC116236 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC116236, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC116236 BINDING SITE, designated SEQ ID:36542, to the nucleotide sequence of VGAM1043 RNA, herein design-

nated VGAM RNA, also designated SEQ ID:3754.

[38335] Another function of VGAM1043 is therefore inhibition of LOC116236 (Accession XM_057674). Accordingly, utilities of VGAM1043 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC116236. LOC135398 (Accession XM_069333) is another VGAM1043 host target gene. LOC135398 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC135398, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC135398 BINDING SITE, designated SEQ ID:37387, to the nucleotide sequence of VGAM1043 RNA, herein designated VGAM RNA, also designated SEQ ID:3754.

[38336] Another function of VGAM1043 is therefore inhibition of LOC135398 (Accession XM_069333). Accordingly, utilities of VGAM1043 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC135398. LOC143719 (Accession XM_027090) is another VGAM1043 host target gene. LOC143719 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC143719, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143719 BINDING SITE, designated SEQ ID:30404, to the nucleotide sequence of VGAM1043 RNA, herein designated VGAM RNA, also designated SEQ ID:3754.

[38337] Another function of VGAM1043 is therefore inhibition of LOC143719 (Accession XM_027090). Accordingly, utilities of VGAM1043 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143719. LOC144438 (Accession XM_084860) is another VGAM1043 host target gene. LOC144438 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC144438, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144438 BINDING SITE, designated SEQ ID:37734, to the nucleotide sequence of VGAM1043 RNA, herein designated VGAM RNA, also designated SEQ ID:3754.

[38338] Another function of VGAM1043 is therefore inhibition of LOC144438 (Accession XM_084860). Accordingly, utilities of VGAM1043 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC144438. LOC144519 (Accession XM_084890) is another VGAM1043 host target gene. LOC144519 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC144519, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144519 BINDING SITE, designated SEQ ID:37756, to the nucleotide sequence of VGAM1043 RNA, herein designated VGAM RNA, also designated SEQ ID:3754.

[38339] Another function of VGAM1043 is therefore inhibition of LOC144519 (Accession XM_084890). Accordingly, utilities of VGAM1043 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144519. LOC145842 (Accession XM_085254) is another VGAM1043 host target gene. LOC145842 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC145842, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145842 BINDING SITE, designated SEQ ID:37996, to

the nucleotide sequence of VGAM1043 RNA, herein designated VGAM RNA, also designated SEQ ID:3754.

[38340] Another function of VGAM1043 is therefore inhibition of LOC145842 (Accession XM_085254). Accordingly, utilities of VGAM1043 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145842. LOC145900 (Accession XM_085276) is another VGAM1043 host target gene. LOC145900 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145900, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145900 BINDING SITE, designated SEQ ID:38013, to the nucleotide sequence of VGAM1043 RNA, herein designated VGAM RNA, also designated SEQ ID:3754.

[38341] Another function of VGAM1043 is therefore inhibition of LOC145900 (Accession XM_085276). Accordingly, utilities of VGAM1043 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145900. LOC145988 (Accession XM_085290) is another VGAM1043 host target gene. LOC145988 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC145988, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145988 BINDING SITE, designated SEQ ID:38041, to the nucleotide sequence of VGAM1043 RNA, herein designated VGAM RNA, also designated SEQ ID:3754.

[38342] Another function of VGAM1043 is therefore inhibition of LOC145988 (Accession XM_085290). Accordingly, utilities of VGAM1043 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145988. LOC146723 (Accession XM_085565) is another VGAM1043 host target gene. LOC146723 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146723, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146723 BINDING SITE, designated SEQ ID:38229, to the nucleotide sequence of VGAM1043 RNA, herein designated VGAM RNA, also designated SEQ ID:3754.

[38343] Another function of VGAM1043 is therefore inhibition of LOC146723 (Accession XM_085565). Accordingly, utilities

of VGAM1043 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146723. LOC148266 (Accession XM_086128) is another VGAM1043 host target gene. LOC148266 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC148266, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148266 BINDING SITE, designated SEQ ID:38512, to the nucleotide sequence of VGAM1043 RNA, herein designated VGAM RNA, also designated SEQ ID:3754.

[38344] Another function of VGAM1043 is therefore inhibition of LOC148266 (Accession XM_086128). Accordingly, utilities of VGAM1043 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148266. LOC150174 (Accession XM_086802) is another VGAM1043 host target gene. LOC150174 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150174, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC150174 BINDING SITE, designated SEQ ID:38874, to the nucleotide sequence of VGAM1043 RNA, herein designated VGAM RNA, also designated SEQ ID:3754.

[38345] Another function of VGAM1043 is therefore inhibition of LOC150174 (Accession XM_086802). Accordingly, utilities of VGAM1043 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150174. LOC150213 (Accession XM_059324) is another VGAM1043 host target gene. LOC150213 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150213, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150213 BINDING SITE, designated SEQ ID:36960, to the nucleotide sequence of VGAM1043 RNA, herein designated VGAM RNA, also designated SEQ ID:3754.

[38346] Another function of VGAM1043 is therefore inhibition of LOC150213 (Accession XM_059324). Accordingly, utilities of VGAM1043 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150213. LOC152313 (Accession XM_098190) is another VGAM1043 host target gene. LOC152313 BINDING

SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC152313, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152313 BINDING SITE, designated SEQ ID:41471, to the nucleotide sequence of VGAM1043 RNA, herein designated VGAM RNA, also designated SEQ ID:3754.

[38347] Another function of VGAM1043 is therefore inhibition of LOC152313 (Accession XM_098190). Accordingly, utilities of VGAM1043 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152313. LOC152485 (Accession XM_087479) is another VGAM1043 host target gene. LOC152485 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152485, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152485 BINDING SITE, designated SEQ ID:39281, to the nucleotide sequence of VGAM1043 RNA, herein designated VGAM RNA, also designated SEQ ID:3754.

[38348] Another function of VGAM1043 is therefore inhibition of

LOC152485 (Accession XM_087479). Accordingly, utilities of VGAM1043 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152485. LOC154860 (Accession XM_098623) is another VGAM1043 host target gene. LOC154860 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC154860, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154860 BINDING SITE, designated SEQ ID:41737, to the nucleotide sequence of VGAM1043 RNA, herein designated VGAM RNA, also designated SEQ ID:3754.

[38349] Another function of VGAM1043 is therefore inhibition of LOC154860 (Accession XM_098623). Accordingly, utilities of VGAM1043 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154860. LOC155006 (Accession XM_088117) is another VGAM1043 host target gene. LOC155006 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC155006, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC155006 BINDING SITE, designated SEQ ID:39527, to the nucleotide sequence of VGAM1043 RNA, herein designated VGAM RNA, also designated SEQ ID:3754.

[38350] Another function of VGAM1043 is therefore inhibition of LOC155006 (Accession XM_088117). Accordingly, utilities of VGAM1043 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC155006. LOC158014 (Accession XM_088442) is another VGAM1043 host target gene. LOC158014 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC158014, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158014 BINDING SITE, designated SEQ ID:39694, to the nucleotide sequence of VGAM1043 RNA, herein designated VGAM RNA, also designated SEQ ID:3754.

[38351] Another function of VGAM1043 is therefore inhibition of LOC158014 (Accession XM_088442). Accordingly, utilities of VGAM1043 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158014. LOC158056 (Accession XM_088463) is an-

other VGAM1043 host target gene. LOC158056 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC158056, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158056 BINDING SITE, designated SEQ ID:39718, to the nucleotide sequence of VGAM1043 RNA, herein designated VGAM RNA, also designated SEQ ID:3754.

[38352] Another function of VGAM1043 is therefore inhibition of LOC158056 (Accession XM_088463). Accordingly, utilities of VGAM1043 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158056. LOC163882 (Accession XM_089211) is another VGAM1043 host target gene. LOC163882 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC163882, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC163882 BINDING SITE, designated SEQ ID:39970, to the nucleotide sequence of VGAM1043 RNA, herein designated VGAM RNA, also designated SEQ ID:3754.

[38353] Another function of VGAM1043 is therefore inhibition of LOC163882 (Accession XM_089211). Accordingly, utilities of VGAM1043 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC163882. LOC169021 (Accession XM_095459) is another VGAM1043 host target gene. LOC169021 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC169021, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC169021 BINDING SITE, designated SEQ ID:40257, to the nucleotide sequence of VGAM1043 RNA, herein designated VGAM RNA, also designated SEQ ID:3754.

[38354] Another function of VGAM1043 is therefore inhibition of LOC169021 (Accession XM_095459). Accordingly, utilities of VGAM1043 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC169021. LOC203523 (Accession XM_114713) is another VGAM1043 host target gene. LOC203523 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC203523, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203523 BINDING SITE, designated SEQ ID:43054, to the nucleotide sequence of VGAM1043 RNA, herein designated VGAM RNA, also designated SEQ ID:3754.

[38355] Another function of VGAM1043 is therefore inhibition of LOC203523 (Accession XM_114713). Accordingly, utilities of VGAM1043 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203523. LOC204301 (Accession XM_115306) is another VGAM1043 host target gene. LOC204301 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC204301, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC204301 BINDING SITE, designated SEQ ID:43094, to the nucleotide sequence of VGAM1043 RNA, herein designated VGAM RNA, also designated SEQ ID:3754.

[38356] Another function of VGAM1043 is therefore inhibition of LOC204301 (Accession XM_115306). Accordingly, utilities of VGAM1043 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC204301. LOC219988 (Accession XM_166223) is another VGAM1043 host target gene. LOC219988 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC219988, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219988 BINDING SITE, designated SEQ ID:44040, to the nucleotide sequence of VGAM1043 RNA, herein designated VGAM RNA, also designated SEQ ID:3754.

[38357] Another function of VGAM1043 is therefore inhibition of LOC219988 (Accession XM_166223). Accordingly, utilities of VGAM1043 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219988. LOC220534 (Accession XM_165405) is another VGAM1043 host target gene. LOC220534 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC220534, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220534 BINDING SITE, designated SEQ ID:43617, to the nucleotide sequence of VGAM1043 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3754.

[38358] Another function of VGAM1043 is therefore inhibition of LOC220534 (Accession XM_165405). Accordingly, utilities of VGAM1043 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220534. LOC220538 (Accession XM_165407) is another VGAM1043 host target gene. LOC220538 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC220538, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220538 BINDING SITE, designated SEQ ID:43627, to the nucleotide sequence of VGAM1043 RNA, herein designated VGAM RNA, also designated SEQ ID:3754.

[38359] Another function of VGAM1043 is therefore inhibition of LOC220538 (Accession XM_165407). Accordingly, utilities of VGAM1043 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220538. LOC222234 (Accession XM_168558) is another VGAM1043 host target gene. LOC222234 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC222234, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222234 BINDING SITE, designated SEQ ID:45240, to the nucleotide sequence of VGAM1043 RNA, herein designated VGAM RNA, also designated SEQ ID:3754.

[38360] Another function of VGAM1043 is therefore inhibition of LOC222234 (Accession XM_168558). Accordingly, utilities of VGAM1043 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222234. LOC254358 (Accession XM_170771) is another VGAM1043 host target gene. LOC254358 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC254358, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254358 BINDING SITE, designated SEQ ID:45532, to the nucleotide sequence of VGAM1043 RNA, herein designated VGAM RNA, also designated SEQ ID:3754.

[38361] Another function of VGAM1043 is therefore inhibition of LOC254358 (Accession XM_170771). Accordingly, utilities of VGAM1043 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC254358. LOC254936 (Accession XM_170770) is another VGAM1043 host target gene. LOC254936 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC254936, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254936 BINDING SITE, designated SEQ ID:45529, to the nucleotide sequence of VGAM1043 RNA, herein designated VGAM RNA, also designated SEQ ID:3754.

[38362] Another function of VGAM1043 is therefore inhibition of LOC254936 (Accession XM_170770). Accordingly, utilities of VGAM1043 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254936. LOC257286 (Accession XM_170549) is another VGAM1043 host target gene. LOC257286 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC257286, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257286 BINDING SITE, designated SEQ ID:45374, to

the nucleotide sequence of VGAM1043 RNA, herein designated VGAM RNA, also designated SEQ ID:3754.

[38363] Another function of VGAM1043 is therefore inhibition of LOC257286 (Accession XM_170549). Accordingly, utilities of VGAM1043 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257286. LOC257464 (Accession XM_116972) is another VGAM1043 host target gene. LOC257464 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC257464, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257464 BINDING SITE, designated SEQ ID:43166, to the nucleotide sequence of VGAM1043 RNA, herein designated VGAM RNA, also designated SEQ ID:3754.

[38364] Another function of VGAM1043 is therefore inhibition of LOC257464 (Accession XM_116972). Accordingly, utilities of VGAM1043 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257464. LOC257494 (Accession XM_175212) is another VGAM1043 host target gene. LOC257494 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC257494, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257494 BINDING SITE, designated SEQ ID:46688, to the nucleotide sequence of VGAM1043 RNA, herein designated VGAM RNA, also designated SEQ ID:3754.

[38365] Another function of VGAM1043 is therefore inhibition of LOC257494 (Accession XM_175212). Accordingly, utilities of VGAM1043 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257494. LOC58489 (Accession XM_051862) is another VGAM1043 host target gene. LOC58489 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC58489, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC58489 BINDING SITE, designated SEQ ID:35903, to the nucleotide sequence of VGAM1043 RNA, herein designated VGAM RNA, also designated SEQ ID:3754.

[38366] Another function of VGAM1043 is therefore inhibition of LOC58489 (Accession XM_051862). Accordingly, utilities

of VGAM1043 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC58489. LOC92017 (Accession XM_042234) is another VGAM1043 host target gene. LOC92017 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC92017, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92017 BINDING SITE, designated SEQ ID:33708, to the nucleotide sequence of VGAM1043 RNA, herein designated VGAM RNA, also designated SEQ ID:3754.

[38367] Another function of VGAM1043 is therefore inhibition of LOC92017 (Accession XM_042234). Accordingly, utilities of VGAM1043 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92017. LOC92303 (Accession XM_044108) is another VGAM1043 host target gene. LOC92303 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC92303, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

LOC92303 BINDING SITE, designated SEQ ID:34137, to the nucleotide sequence of VGAM1043 RNA, herein designated VGAM RNA, also designated SEQ ID:3754.

[38368] Another function of VGAM1043 is therefore inhibition of LOC92303 (Accession XM_044108). Accordingly, utilities of VGAM1043 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92303. LOC92822 (Accession XM_047520) is another VGAM1043 host target gene. LOC92822 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC92822, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92822 BINDING SITE, designated SEQ ID:34986, to the nucleotide sequence of VGAM1043 RNA, herein designated VGAM RNA, also designated SEQ ID:3754.

[38369] Another function of VGAM1043 is therefore inhibition of LOC92822 (Accession XM_047520). Accordingly, utilities of VGAM1043 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92822. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 1044 (VGAM1044) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[38370] VGAM1044 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1044 was detected is described hereinabove with reference to Figs. 1–8.

[38371] VGAM1044 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Herpesvirus 8. VGAM1044 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[38372] VGAM1044 gene encodes a VGAM1044 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1044 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1044 precursor RNA is designated SEQ ID:1030, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1030 is located at position 131364 relative to the

genome of Human Herpesvirus 8.

[38373] VGAM1044 precursor RNA folds onto itself, forming VGAM1044 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[38374] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1044 folded precursor RNA into VGAM1044 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 49%) nucleotide sequence of VGAM1044 RNA is designated SEQ ID:3755, and is provided hereinbelow with reference to the sequence listing part.

[38375] VGAM1044 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM1044 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1044 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[38376] VGAM1044 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1044 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1044 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1044 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1044 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[38377] The complementary binding of VGAM1044 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1044 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1044 host target RNA into VGAM1044 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[38378] It is appreciated that VGAM1044 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1044 host target genes. The mRNA of each one of this plurality of VGAM1044 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1044 RNA, herein designated VGAM RNA, and which when bound by VGAM1044 RNA causes inhibition of translation of respective one or more VGAM1044 host target proteins.

[38379] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1044 gene, herein designated VGAM GENE, on one or more VGAM1044 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[38380] It is yet further appreciated that a function of VGAM1044 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1044 include diagnosis, prevention and treatment of viral infection by Human Herpesvirus 8. Specific functions, and accordingly utilities, of VGAM1044

correlate with, and may be deduced from, the identity of the host target genes which VGAM1044 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[38381] Nucleotide sequences of the VGAM1044 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1044 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1044 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1044 are further described hereinbelow with reference to Table 1.

[38382] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1044 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1044 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[38383] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1044 gene, herein designated VGAM is inhibition of expression of VGAM1044 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1044 correlate with, and may be deduced

from, the identity of the target genes which VGAM1044 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[38384] Aldehyde Dehydrogenase 1 Family, Member A3

(ALDH1A3, Accession NM_000693) is a VGAM1044 host target gene. ALDH1A3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ALDH1A3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ALDH1A3 BINDING SITE, designated SEQ ID:6353, to the nucleotide sequence of VGAM1044 RNA, herein designated VGAM RNA, also designated SEQ ID:3755.

[38385] A function of VGAM1044 is therefore inhibition of Aldehyde Dehydrogenase 1 Family, Member A3 (ALDH1A3, Accession NM_000693), a gene which plays a major role in the detoxification of aldehydes generated by alcohol metabolism and lipid peroxidation. Accordingly, utilities of VGAM1044 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ALDH1A3. The function of ALDH1A3 and its association with various diseases and clinical conditions, has been es-

established by previous studies, as described hereinabove with reference to VGAM565.UDP-Gal:betaGlcNAc Beta 1,4- Galactosyltransferase, Polypeptide 1 (B4GALT1, Accession NM_001497) is another VGAM1044 host target gene. B4GALT1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by B4GALT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of B4GALT1 BINDING SITE, designated SEQ ID:7244, to the nucleotide sequence of VGAM1044 RNA, herein designated VGAM RNA, also designated SEQ ID:3755.

[38386] Another function of VGAM1044 is therefore inhibition of UDP-Gal:betaGlcNAc Beta 1,4- Galactosyltransferase, Polypeptide 1 (B4GALT1, Accession NM_001497). Accordingly, utilities of VGAM1044 include diagnosis, prevention and treatment of diseases and clinical conditions associated with B4GALT1. Prokineticin 1 (PROK1, Accession NM_032414) is another VGAM1044 host target gene. PROK1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PROK1, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PROK1 BINDING SITE, designated SEQ ID:26197, to the nucleotide sequence of VGAM1044 RNA, herein designated VGAM RNA, also designated SEQ ID:3755.

[38387] Another function of VGAM1044 is therefore inhibition of Prokineticin 1 (PROK1, Accession NM_032414), a gene which induces proliferation, migration and fenestration in capillary endothelial cells derived from endocrine glands. Accordingly, utilities of VGAM1044 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PROK1. The function of PROK1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1000. Solute Carrier Family 21 (prostaglandin transporter), Member 2 (SLC21A2, Accession NM_005630) is another VGAM1044 host target gene. SLC21A2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC21A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of SLC21A2 BINDING SITE, designated SEQ ID:12158, to the nucleotide sequence of VGAM1044 RNA, herein designated VGAM RNA, also designated SEQ ID:3755.

[38388] Another function of VGAM1044 is therefore inhibition of Solute Carrier Family 21 (prostaglandin transporter), Member 2 (SLC21A2, Accession NM_005630), a gene which is a Prostaglandin transporter. Accordingly, utilities of VGAM1044 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC21A2. The function of SLC21A2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM83.Unc-119 Homolog (*C. elegans*) (UNC119, Accession NM_005148) is another VGAM1044 host target gene. UNC119 BINDING SITE1 and UNC119 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by UNC119, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UNC119 BINDING SITE1 and UNC119 BINDING SITE2, designated SEQ ID:11620 and SEQ ID:27646 respectively,

to the nucleotide sequence of VGAM1044 RNA, herein designated VGAM RNA, also designated SEQ ID:3755.

[38389] Another function of VGAM1044 is therefore inhibition of Unc-119 Homolog (*C. elegans*) (UNC119, Accession NM_005148), a gene which is expressed in the retina and may play a role in the mechanism of photoreceptor neurotransmitter release through the synaptic vesicle cycle. Accordingly, utilities of VGAM1044 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UNC119. The function of UNC119 has been established by previous studies. Using a subtractive hybridization strategy, Higashide et al. (1996) identified a retina-specific cDNA that they designated HRG4 (human retinal gene-4). Northern blot analysis revealed that the approximately 1.4-kb HRG4 mRNA is expressed specifically in human retina. The authors also cloned a cDNA encoding RRG4, the rat HRG4 homolog. The predicted 240-amino acid human and rat proteins both contain an N-terminal region rich in proline and glycine followed by a region with a mixture of alpha helices, beta sheets, and turns. Sequence comparisons indicated that the proline-glycine domains of RRG4 and HRG4 share only 67% homology, while the rest of the sequence

is 100% identical. By in situ hybridization, Higashide et al. (1996) demonstrated that the HRG4 gene is expressed specifically in photoreceptors, both rods and cones, in human retina. In rat, the authors observed high levels of RRG4 expression in the outer retina beginning around postnatal day 5, when the photoreceptors begin to differentiate, and expression increased rapidly to reach the adult level by postnatal day 23. Mutations in the *C. elegans* *unc119* gene lead to defects in locomotion, feeding behavior, and chemosensation. Both Swanson et al. (1998) and Higashide et al. (1998) observed that HRG4 shares strong homology with the *C. elegans* *unc119* protein, leading Swanson et al. (1998) to designate the human protein UNC119. Swanson et al. (1998) stated that a human UNC119 cDNA functionally complemented the *C. elegans* *unc119* mutation. Using immunofluorescence, Higashide et al. (1998) localized HRG4 to the outer plexiform layer of the retina in the synaptic termini of rod and cone photoreceptors. Electron microscopic immunolocalization showed that the protein is present in the cytoplasm and on the presynaptic membranes of the photoreceptor synapses. The authors suggested that HRG4 may play a role in the mechanism of photoreceptor neuro-

transmitter release through the synaptic vesicle cycle. They noted that the homology of HRG4 and unc119 is consistent with a possible role of HRG4 in the synaptic vesicle cycle, because the broad effects of unc119 on neuronal function are consistent with a defect in neurotransmission.

[38390] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[38391] Higashide, T.; Murakami, A.; McLaren, M. J.; Inana, G. : Cloning of the cDNA for a novel photoreceptor protein. J. Biol. Chem. 271: 1797–1804, 1996. ; and

[38392] Swanson, D. A.; Chang, J. T.; Campochiaro, P. A.; Zack, D. J.; Valle, D. : Mammalian orthologs of *C. elegans* unc-119 highly expressed in photoreceptors. Invest. Ophthalm. Vis. Sci. 39: 20.

[38393] Further studies establishing the function and utilities of UNC119 are found in John Hopkins OMIM database record ID 604011, and in cited publications numbered 7608–7611 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Double C2-like Domains, Beta (DOC2B, Accession NM_003585) is another VGAM1044 host target gene. DOC2B BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DOC2B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DOC2B BINDING SITE, designated SEQ ID:9636, to the nucleotide sequence of VGAM1044 RNA, herein designated VGAM RNA, also designated SEQ ID:3755.

[38394] Another function of VGAM1044 is therefore inhibition of Double C2-like Domains, Beta (DOC2B, Accession NM_003585). Accordingly, utilities of VGAM1044 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DOC2B. KIAA0767 (Accession XM_027105) is another VGAM1044 host target gene. KIAA0767 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0767, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0767 BINDING SITE, designated SEQ ID:30407, to the nucleotide sequence of VGAM1044 RNA, herein designated VGAM RNA, also designated SEQ ID:3755.

[38395] Another function of VGAM1044 is therefore inhibition of KIAA0767 (Accession XM_027105). Accordingly, utilities of VGAM1044 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0767. KIAA1297 (Accession XM_051005) is another VGAM1044 host target gene. KIAA1297 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1297, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1297 BINDING SITE, designated SEQ ID:35711, to the nucleotide sequence of VGAM1044 RNA, herein designated VGAM RNA, also designated SEQ ID:3755.

[38396] Another function of VGAM1044 is therefore inhibition of KIAA1297 (Accession XM_051005). Accordingly, utilities of VGAM1044 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1297. KIAA1822 (Accession XM_041566) is another VGAM1044 host target gene. KIAA1822 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1822, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1822 BINDING SITE, designated SEQ ID:33554, to the nucleotide sequence of VGAM1044 RNA, herein designated VGAM RNA, also designated SEQ ID:3755.

[38397] Another function of VGAM1044 is therefore inhibition of KIAA1822 (Accession XM_041566). Accordingly, utilities of VGAM1044 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1822. NRF (Accession NM_017544) is another VGAM1044 host target gene. NRF BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NRF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NRF BINDING SITE, designated SEQ ID:18984, to the nucleotide sequence of VGAM1044 RNA, herein designated VGAM RNA, also designated SEQ ID:3755.

[38398] Another function of VGAM1044 is therefore inhibition of NRF (Accession NM_017544). Accordingly, utilities of VGAM1044 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NRF.

Tubby Homolog (mouse) (TUB, Accession NM_003320) is another VGAM1044 host target gene. TUB BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TUB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TUB BINDING SITE, designated SEQ ID:9322, to the nucleotide sequence of VGAM1044 RNA, herein designated VGAM RNA, also designated SEQ ID:3755.

[38399] Another function of VGAM1044 is therefore inhibition of Tubby Homolog (mouse) (TUB, Accession NM_003320). Accordingly, utilities of VGAM1044 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TUB. LOC127702 (Accession XM_060619) is another VGAM1044 host target gene. LOC127702 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC127702, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC127702 BINDING SITE, designated SEQ ID:37180, to the nucleotide sequence of

VGAM1044 RNA, herein designated VGAM RNA, also designated SEQ ID:3755.

[38400] Another function of VGAM1044 is therefore inhibition of LOC127702 (Accession XM_060619). Accordingly, utilities of VGAM1044 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC127702. LOC150407 (Accession XM_086906) is another VGAM1044 host target gene. LOC150407 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150407, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150407 BINDING SITE, designated SEQ ID:38950, to the nucleotide sequence of VGAM1044 RNA, herein designated VGAM RNA, also designated SEQ ID:3755.

[38401] Another function of VGAM1044 is therefore inhibition of LOC150407 (Accession XM_086906). Accordingly, utilities of VGAM1044 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150407. LOC166341 (Accession XM_093804) is another VGAM1044 host target gene. LOC166341 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC166341, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC166341 BINDING SITE, designated SEQ ID:40210, to the nucleotide sequence of VGAM1044 RNA, herein designated VGAM RNA, also designated SEQ ID:3755.

[38402] Another function of VGAM1044 is therefore inhibition of LOC166341 (Accession XM_093804). Accordingly, utilities of VGAM1044 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC166341. LOC219942 (Accession XM_167790) is another VGAM1044 host target gene. LOC219942 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC219942, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219942 BINDING SITE, designated SEQ ID:44824, to the nucleotide sequence of VGAM1044 RNA, herein designated VGAM RNA, also designated SEQ ID:3755.

[38403] Another function of VGAM1044 is therefore inhibition of LOC219942 (Accession XM_167790). Accordingly, utilities

of VGAM1044 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219942. LOC253868 (Accession XM_170975) is another VGAM1044 host target gene. LOC253868 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC253868, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253868 BINDING SITE, designated SEQ ID:45751, to the nucleotide sequence of VGAM1044 RNA, herein designated VGAM RNA, also designated SEQ ID:3755.

[38404] Another function of VGAM1044 is therefore inhibition of LOC253868 (Accession XM_170975). Accordingly, utilities of VGAM1044 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253868. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1045 (VGAM1045) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[38405] VGAM1045 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1045 was detected is described hereinabove with reference to Figs. 1–8.

[38406] VGAM1045 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Sulfolobus Virus SIRV–1. VGAM1045 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[38407] VGAM1045 gene encodes a VGAM1045 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1045 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1045 precursor RNA is designated SEQ ID:1031, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1031 is located at position 26929 relative to the genome of Sulfolobus Virus SIRV–1.

[38408] VGAM1045 precursor RNA folds onto itself, forming VGAM1045 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the

art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[38409] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1045 folded precursor RNA into VGAM1045 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM1045 RNA is designated SEQ ID:3756, and is provided hereinbelow with reference to the sequence listing part.

[38410] VGAM1045 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1045 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1045 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated

5`UTR, PROTEIN CODING and 3`UTR respectively.

[38411] VGAM1045 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1045 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1045 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1045 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1045 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[38412] The complementary binding of VGAM1045 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1045 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1045 host target RNA into VGAM1045 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[38413] It is appreciated that VGAM1045 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1045 host target genes. The mRNA of each one of this plurality of VGAM1045 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1045 RNA, herein designated VGAM RNA, and which when bound by VGAM1045 RNA causes inhibition of translation of respective one or more VGAM1045 host target proteins.

[38414] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1045 gene, herein designated VGAM GENE, on one or more VGAM1045 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[38415] It is yet further appreciated that a function of VGAM1045 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1045 include diagnosis, prevention and treatment of viral infection by Sulfolobus Virus SIRV-1. Specific functions, and accordingly utilities, of VGAM1045 correlate with, and may be deduced from, the identity of the host target genes which VGAM1045 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[38416] Nucleotide sequences of the VGAM1045 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the
`diced` VGAM1045 RNA, herein designated VGAM RNA,
and a schematic representation of the secondary folding
of VGAM1045 folded precursor RNA, herein designated
VGAM FOLDED PRECURSOR RNA, of VGAM1045 are further
described hereinbelow with reference to Table 1.

[38417] Nucleotide sequences of host target binding sites, such as
BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of
Fig. 1, found on VGAM1045 host target RNA, and
schematic representation of the complementarity of each
of these host target binding sites to VGAM1045 RNA,
herein designated VGAM RNA, are described hereinbelow
with reference to Table 2.

[38418] As mentioned hereinabove with reference to Fig. 1, a
function of VGAM1045 gene, herein designated VGAM is
inhibition of expression of VGAM1045 target genes. It is
appreciated that specific functions, and accordingly utili-
ties, of VGAM1045 correlate with, and may be deduced
from, the identity of the target genes which VGAM1045
binds and inhibits, and the function of these target genes,
as elaborated hereinbelow.

[38419] Enamelin (ENAM, Accession NM_031889) is a VGAM1045
host target gene. ENAM BINDING SITE is HOST TARGET

binding site found in the 3' untranslated region of mRNA encoded by ENAM, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ENAM BINDING SITE, designated SEQ ID:25633, to the nucleotide sequence of VGAM1045 RNA, herein designated VGAM RNA, also designated SEQ ID:3756.

[38420] A function of VGAM1045 is therefore inhibition of Enamelin (ENAM, Accession NM_031889). Accordingly, utilities of VGAM1045 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ENAM. MAX Interacting Protein 1 (MXI1, Accession NM_005962) is another VGAM1045 host target gene. MXI1 BINDING SITE1 and MXI1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by MXI1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MXI1 BINDING SITE1 and MXI1 BINDING SITE2, designated SEQ ID:12585 and SEQ ID:28195 respectively, to the nucleotide sequence of VGAM1045 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:3756.

[38421] Another function of VGAM1045 is therefore inhibition of MAX Interacting Protein 1 (MXI1, Accession NM_005962), a gene which acts as a tumor suppressor in vivo, engages the MYC network in a functionally relevant manner. Accordingly, utilities of VGAM1045 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MXI1. The function of MXI1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM128. Rabphilin 3A-like (without C2 domains) (RPH3AL, Accession NM_006987) is another VGAM1045 host target gene. RPH3AL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RPH3AL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RPH3AL BINDING SITE, designated SEQ ID:13847, to the nucleotide sequence of VGAM1045 RNA, herein designated VGAM RNA, also designated SEQ ID:3756.

[38422] Another function of VGAM1045 is therefore inhibition of Rabphilin 3A-like (without C2 domains) (RPH3AL, Acces-

sion NM_006987), a gene which is a protein transporter. could play a role in neurotransmitter release by regulating membrane flow in the nerve terminal. Accordingly, utilities of VGAM1045 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RPH3AL. The function of RPH3AL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM923. FHR5 (Accession NM_030787) is another VGAM1045 host target gene. FHR5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FHR5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FHR5 BINDING SITE, designated SEQ ID:25085, to the nucleotide sequence of VGAM1045 RNA, herein designated VGAM RNA, also designated SEQ ID:3756.

[38423] Another function of VGAM1045 is therefore inhibition of FHR5 (Accession NM_030787). Accordingly, utilities of VGAM1045 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FHR5. FLJ10922 (Accession NM_018273) is another VGAM1045

host target gene. FLJ10922 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10922, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10922 BINDING SITE, designated SEQ ID:20257, to the nucleotide sequence of VGAM1045 RNA, herein designated VGAM RNA, also designated SEQ ID:3756.

[38424] Another function of VGAM1045 is therefore inhibition of FLJ10922 (Accession NM_018273). Accordingly, utilities of VGAM1045 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10922. FLJ20730 (Accession NM_017945) is another VGAM1045 host target gene. FLJ20730 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20730, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20730 BINDING SITE, designated SEQ ID:19642, to the nucleotide sequence of VGAM1045 RNA, herein designated VGAM RNA, also designated SEQ ID:3756.

[38425] Another function of VGAM1045 is therefore inhibition of FLJ20730 (Accession NM_017945). Accordingly, utilities of VGAM1045 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20730. FLJ21820 (Accession NM_021925) is another VGAM1045 host target gene. FLJ21820 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21820, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21820 BINDING SITE, designated SEQ ID:22453, to the nucleotide sequence of VGAM1045 RNA, herein designated VGAM RNA, also designated SEQ ID:3756.

[38426] Another function of VGAM1045 is therefore inhibition of FLJ21820 (Accession NM_021925). Accordingly, utilities of VGAM1045 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21820. ICK (Accession NM_014920) is another VGAM1045 host target gene. ICK BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ICK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ICK BINDING SITE, designated SEQ ID:17197, to the nucleotide sequence of VGAM1045 RNA, herein designated VGAM RNA, also designated SEQ ID:3756.

[38427] Another function of VGAM1045 is therefore inhibition of ICK (Accession NM_014920). Accordingly, utilities of VGAM1045 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ICK. IPLA2(GAMMA) (Accession XM_027224) is another VGAM1045 host target gene. IPLA2(GAMMA) BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by IPLA2(GAMMA), corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IPLA2(GAMMA) BINDING SITE, designated SEQ ID:30446, to the nucleotide sequence of VGAM1045 RNA, herein designated VGAM RNA, also designated SEQ ID:3756.

[38428] Another function of VGAM1045 is therefore inhibition of IPLA2(GAMMA) (Accession XM_027224). Accordingly, utilities of VGAM1045 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with IPLA2(GAMMA). KIAA0276 (Accession XM_048199) is another VGAM1045 host target gene. KIAA0276 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0276, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0276 BINDING SITE, designated SEQ ID:35136, to the nucleotide sequence of VGAM1045 RNA, herein designated VGAM RNA, also designated SEQ ID:3756.

[38429] Another function of VGAM1045 is therefore inhibition of KIAA0276 (Accession XM_048199). Accordingly, utilities of VGAM1045 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0276. moblak (Accession NM_130807) is another VGAM1045 host target gene. moblak BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by moblak, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of moblak BINDING SITE, designated SEQ ID:28311, to the nucleotide sequence of VGAM1045 RNA, herein designated VGAM RNA,

also designated SEQ ID:3756.

[38430] Another function of VGAM1045 is therefore inhibition of moblak (Accession NM_130807). Accordingly, utilities of VGAM1045 include diagnosis, prevention and treatment of diseases and clinical conditions associated with moblak. LOC221760 (Accession XM_168105) is another VGAM1045 host target gene. LOC221760 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221760, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221760 BINDING SITE, designated SEQ ID:45032, to the nucleotide sequence of VGAM1045 RNA, herein designated VGAM RNA, also designated SEQ ID:3756.

[38431] Another function of VGAM1045 is therefore inhibition of LOC221760 (Accession XM_168105). Accordingly, utilities of VGAM1045 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221760. LOC257422 (Accession XM_172923) is another VGAM1045 host target gene. LOC257422 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC257422, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257422 BINDING SITE, designated SEQ ID:46189, to the nucleotide sequence of VGAM1045 RNA, herein designated VGAM RNA, also designated SEQ ID:3756.

[38432] Another function of VGAM1045 is therefore inhibition of LOC257422 (Accession XM_172923). Accordingly, utilities of VGAM1045 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257422. LOC90459 (Accession XM_031826) is another VGAM1045 host target gene. LOC90459 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90459, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90459 BINDING SITE, designated SEQ ID:31492, to the nucleotide sequence of VGAM1045 RNA, herein designated VGAM RNA, also designated SEQ ID:3756.

[38433] Another function of VGAM1045 is therefore inhibition of LOC90459 (Accession XM_031826). Accordingly, utilities of VGAM1045 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC90459. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1046 (VGAM1046) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[38434] VGAM1046 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1046 was detected is described hereinabove with reference to Figs. 1–8.

[38435] VGAM1046 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Herpesvirus 8. VGAM1046 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[38436] VGAM1046 gene encodes a VGAM1046 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1046 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1046 precursor RNA is desig-

nated SEQ ID:1032, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1032 is located at position 131131 relative to the genome of Human Herpesvirus 8.

- [38437] VGAM1046 precursor RNA folds onto itself, forming VGAM1046 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [38438] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1046 folded precursor RNA into VGAM1046 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 70%) nucleotide sequence of VGAM1046 RNA is designated SEQ ID:3757, and is provided hereinbelow with reference to the sequence

listing part.

[38439] VGAM1046 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1046 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1046 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[38440] VGAM1046 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1046 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1046 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1046 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM1046 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[38441] The complementary binding of VGAM1046 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1046 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1046 host target RNA into VGAM1046 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[38442] It is appreciated that VGAM1046 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1046 host target genes. The mRNA of each one of this plurality of VGAM1046 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1046 RNA, herein designated VGAM

RNA, and which when bound by VGAM1046 RNA causes inhibition of translation of respective one or more VGAM1046 host target proteins.

[38443] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1046 gene, herein designated VGAM GENE, on one or more VGAM1046 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[38444] It is yet further appreciated that a function of VGAM1046 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM1046 include diagnosis, prevention and treatment of viral infection by Human Herpesvirus 8. Specific functions, and accordingly utilities, of VGAM1046 correlate with, and may be deduced from, the identity of the host target genes which VGAM1046 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[38445] Nucleotide sequences of the VGAM1046 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1046 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1046 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1046 are further described hereinbelow with reference to Table 1.

[38446] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1046 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1046 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[38447] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1046 gene, herein designated VGAM is

inhibition of expression of VGAM1046 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1046 correlate with, and may be deduced from, the identity of the target genes which VGAM1046 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[38448] Potassium Voltage-gated Channel, KQT-like Subfamily, Member 1 (KCNQ1, Accession NM_000218) is a VGAM1046 host target gene. KCNQ1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KCNQ1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNQ1 BINDING SITE, designated SEQ ID:5721, to the nucleotide sequence of VGAM1046 RNA, herein designated VGAM RNA, also designated SEQ ID:3757.

[38449] A function of VGAM1046 is therefore inhibition of Potassium Voltage-gated Channel, KQT-like Subfamily, Member 1 (KCNQ1, Accession NM_000218), a gene which probably important in cardiac repolarization. associates with kcne1 (mink) to form the i(ks) cardiac potassium current. elicits a rapidly activating, k(+)-selective outward

current. muscarinic agonist oxotremorine-m strongly suppresses kcnq1/kcne1 current in cho cells in which cloned kcnq1/kcne1 channels were coexpressed with m1 muscarinic receptors. may associate also with kcne3 (mirp2) to form the potassium channel that is important for cyclic amp-stimulated intestinal secretion of chloride

io TISSUE:abondantly expressed in heart, pancreas, prostate, kidney, small intestine and peripheral blood leukocytes. less abundant in placenta, lung, spleen, colon, thymus, testis and ovaries. Accordingly, utilities of VGAM1046 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNQ1. The function of KCNQ1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM339.DKFZP761D0211 (Accession NM_032039) is another VGAM1046 host target gene. DKFZP761D0211 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DK-FZP761D0211, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP761D0211 BINDING SITE,

designated SEQ ID:25735, to the nucleotide sequence of VGAM1046 RNA, herein designated VGAM RNA, also designated SEQ ID:3757.

[38450] Another function of VGAM1046 is therefore inhibition of DKFZP761D0211 (Accession NM_032039). Accordingly, utilities of VGAM1046 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP761D0211. LOC149132 (Accession XM_086428) is another VGAM1046 host target gene. LOC149132 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC149132, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149132 BINDING SITE, designated SEQ ID:38643, to the nucleotide sequence of VGAM1046 RNA, herein designated VGAM RNA, also designated SEQ ID:3757.

[38451] Another function of VGAM1046 is therefore inhibition of LOC149132 (Accession XM_086428). Accordingly, utilities of VGAM1046 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149132. LOC255975 (Accession XM_171083) is an-

other VGAM1046 host target gene. LOC255975 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC255975, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255975 BINDING SITE, designated SEQ ID:45887, to the nucleotide sequence of VGAM1046 RNA, herein designated VGAM RNA, also designated SEQ ID:3757.

[38452] Another function of VGAM1046 is therefore inhibition of LOC255975 (Accession XM_171083). Accordingly, utilities of VGAM1046 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255975. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1047 (VGAM1047) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[38453] VGAM1047 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1047 was detected is de-

scribed hereinabove with reference to Figs. 1–8.

[38454] VGAM1047 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Strawberry Mild Yellow Edge Virus. VGAM1047 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[38455] VGAM1047 gene encodes a VGAM1047 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1047 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1047 precursor RNA is designated SEQ ID:1033, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1033 is located at position 3766 relative to the genome of Strawberry Mild Yellow Edge Virus.

[38456] VGAM1047 precursor RNA folds onto itself, forming VGAM1047 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA

gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[38457] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1047 folded precursor RNA into VGAM1047 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of VGAM1047 RNA is designated SEQ ID:3758, and is provided hereinbelow with reference to the sequence listing part.

[38458] VGAM1047 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1047 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1047 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[38459] VGAM1047 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM1047 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1047 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1047 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1047 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[38460] The complementary binding of VGAM1047 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1047 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1047 host target RNA into VGAM1047 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[38461] It is appreciated that VGAM1047 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1047 host target genes. The mRNA of each one of this plurality of VGAM1047 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1047 RNA, herein designated VGAM RNA, and which when bound by VGAM1047 RNA causes inhibition of translation of respective one or more VGAM1047 host target proteins.

[38462] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1047 gene, herein designated VGAM GENE, on one or more VGAM1047 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[38463] It is yet further appreciated that a function of VGAM1047 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1047 include diagnosis, prevention and treatment of viral infection by Strawberry Mild Yellow Edge Virus. Specific functions, and accordingly utilities, of VGAM1047 correlate with, and may be deduced from, the identity of the host target genes which VGAM1047 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[38464] Nucleotide sequences of the VGAM1047 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1047 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding

of VGAM1047 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1047 are further described hereinbelow with reference to Table 1.

[38465] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1047 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1047 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[38466] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1047 gene, herein designated VGAM is inhibition of expression of VGAM1047 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1047 correlate with, and may be deduced from, the identity of the target genes which VGAM1047 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[38467] Homeo Box C13 (HOXC13, Accession XM_006804) is a VGAM1047 host target gene. HOXC13 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HOXC13, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HOXC13 BINDING SITE, designated SEQ ID:30016, to the nucleotide sequence of VGAM1047 RNA, herein designated VGAM RNA, also designated SEQ ID:3758.

[38468] A function of VGAM1047 is therefore inhibition of Homeo Box C13 (HOXC13, Accession XM_006804). Accordingly, utilities of VGAM1047 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HOXC13. P53AIP1 (Accession NM_022112) is another VGAM1047 host target gene. P53AIP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by P53AIP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of P53AIP1 BINDING SITE, designated SEQ ID:22658, to the nucleotide sequence of VGAM1047 RNA, herein designated VGAM RNA, also designated SEQ ID:3758.

[38469] Another function of VGAM1047 is therefore inhibition of P53AIP1 (Accession NM_022112). Accordingly, utilities of VGAM1047 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

P53AIP1. Vinculin (VCL, Accession NM_003373) is another VGAM1047 host target gene. VCL BINDING SITE1 and VCL BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by VCL, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VCL BINDING SITE1 and VCL BINDING SITE2, designated SEQ ID:9403 and SEQ ID:15192 respectively, to the nucleotide sequence of VGAM1047 RNA, herein designated VGAM RNA, also designated SEQ ID:3758.

[38470] Another function of VGAM1047 is therefore inhibition of Vinculin (VCL, Accession NM_003373). Accordingly, utilities of VGAM1047 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VCL. MGC11242 (Accession NM_024320) is another VGAM1047 host target gene. MGC11242 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC11242, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC11242 BINDING SITE, designated SEQ ID:23610, to

the nucleotide sequence of VGAM1047 RNA, herein designated VGAM RNA, also designated SEQ ID:3758.

[38471] Another function of VGAM1047 is therefore inhibition of MGC11242 (Accession NM_024320). Accordingly, utilities of VGAM1047 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC11242. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1048 (VGAM1048) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[38472] VGAM1048 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1048 was detected is described hereinabove with reference to Figs. 1–8.

[38473] VGAM1048 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Strawberry Mild Yellow Edge Virus. VGAM1048 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[38474] VGAM1048 gene encodes a VGAM1048 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1048 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1048 precursor RNA is designated SEQ ID:1034, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1034 is located at position 1114 relative to the genome of Strawberry Mild Yellow Edge Virus.

[38475] VGAM1048 precursor RNA folds onto itself, forming VGAM1048 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[38476] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1048 folded precursor RNA into VGAM1048 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 47%) nucleotide sequence of VGAM1048 RNA is designated SEQ ID:3759, and is provided hereinbelow with reference to the sequence listing part.

[38477] VGAM1048 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1048 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1048 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[38478] VGAM1048 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1048 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1048 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1048 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1048 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[38479] The complementary binding of VGAM1048 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1048 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1048 host target RNA into VGAM1048 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[38480] It is appreciated that VGAM1048 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM1048 host target genes. The mRNA of each one of this plurality of VGAM1048 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1048 RNA, herein designated VGAM RNA, and which when bound by VGAM1048 RNA causes inhibition of translation of respective one or more VGAM1048 host target proteins.

[38481] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1048 gene, herein designated VGAM GENE, on one or more VGAM1048 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science
294,779 (2001)).

[38482] It is yet further appreciated that a function of VGAM1048 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1048 include diagnosis, prevention and treatment of viral infection by Strawberry Mild Yellow Edge Virus. Specific functions, and accordingly utilities, of VGAM1048 correlate with, and may be deduced from, the identity of the host target genes which VGAM1048 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[38483] Nucleotide sequences of the VGAM1048 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1048 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1048 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1048 are further described hereinbelow with reference to Table 1.

[38484] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1048 host target RNA, and schematic representation of the complementarity of each

of these host target binding sites to VGAM1048 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[38485] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1048 gene, herein designated VGAM is inhibition of expression of VGAM1048 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1048 correlate with, and may be deduced from, the identity of the target genes which VGAM1048 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[38486] Adaptor-related Protein Complex 1, Beta 1 Subunit (AP1B1, Accession NM_001127) is a VGAM1048 host target gene. AP1B1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AP1B1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AP1B1 BINDING SITE, designated SEQ ID:6797, to the nucleotide sequence of VGAM1048 RNA, herein designated VGAM RNA, also designated SEQ ID:3759.

[38487] A function of VGAM1048 is therefore inhibition of Adap-

tor-related Protein Complex 1, Beta 1 Subunit (AP1B1, Accession NM_001127), a gene which plays a role in protein sorting in the late-golgi/trans-golgi network (tgn) and/or endosomes. Accordingly, utilities of VGAM1048 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AP1B1. The function of AP1B1 has been established by previous studies. A 140-kb homozygous deletion in 22q12 in a sporadic meningioma directed Peyrard et al. (1994) to the cloning and characterization of a new member of the human beta-adaptin gene family, which was named BAM22 for 'beta-adaptin-meningioma-chromosome 22.' The BAM22 gene was totally inactivated in the tumor with homozygous deletion. Northern blot analysis of 70 sporadic meningiomas showed specific loss of expression in 8 tumors, suggesting inactivation of BAM22. Based on this, Peyrard et al. (1994) suggested that BAM22 is a second chromosome 22 locus important in meningioma development and second in importance to the neurofibromatosis type 2 gene (NF2; 101000). The likelihood that multiple loci on chromosome 22 are involved in the oncogenesis of meningioma is suggested by the facts that monosomy 22 is observed in as many as 65% of tumors (Zankl and Zang,

1980); some meningiomas have chromosome 22 deletions not encompassing the NF2 gene region and do not show mutations in the NF2 gene; and constitutional ring chromosome 22 has been observed in young patients with multiple tumors (Arinami et al., 1986; Petrella et al., 1993).

[38488] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[38489] Peyrard, M.; Pan, H.-Q.; Kedra, D.; Fransson, I.; Swahn, S.; Hartman, K.; Clifton, S. W.; Roe, B. A.; Dumanski, J. P. : Structure of the promoter and genomic organization of the human beta-prime-adaptin gene (BAM22) from chromosome 22q12. Genomics 36: 112-117, 1996. ; and

[38490] Zankl, H.; Zang, K. D. : Correlations between clinical and cytogenetical data in 180 human meningiomas. Cancer Genet. Cytogenet. 1: 351-356, 1980.

[38491] Further studies establishing the function and utilities of AP1B1 are found in John Hopkins OMIM database record ID 600157, and in cited publications numbered 754 and 12596-7550 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Piccolo (presynaptic cytomatrix protein) (PCLO, Ac-

cession XM_168530) is another VGAM1048 host target gene. PCLO BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PCLO, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCLO BINDING SITE, designated SEQ ID:45213, to the nucleotide sequence of VGAM1048 RNA, herein designated VGAM RNA, also designated SEQ ID:3759.

[38492] Another function of VGAM1048 is therefore inhibition of Piccolo (presynaptic cytomatrix protein) (PCLO, Accession XM_168530), a gene which involves in the cycling of synaptic vesicles. Accordingly, utilities of VGAM1048 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCLO. The function of PCLO and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM71. TRHDE (Accession NM_013381) is another VGAM1048 host target gene. TRHDE BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRHDE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of TRHDE BINDING SITE, designated SEQ ID:15032, to the nucleotide sequence of VGAM1048 RNA, herein designated VGAM RNA, also designated SEQ ID:3759.

[38493] Another function of VGAM1048 is therefore inhibition of TRHDE (Accession NM_013381). Accordingly, utilities of VGAM1048 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRHDE. FLJ10932 (Accession NM_018277) is another VGAM1048 host target gene. FLJ10932 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10932, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10932 BINDING SITE, designated SEQ ID:20262, to the nucleotide sequence of VGAM1048 RNA, herein designated VGAM RNA, also designated SEQ ID:3759.

[38494] Another function of VGAM1048 is therefore inhibition of FLJ10932 (Accession NM_018277). Accordingly, utilities of VGAM1048 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

FLJ10932. KIAA0349 (Accession XM_166449) is another VGAM1048 host target gene. KIAA0349 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0349, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0349 BINDING SITE, designated SEQ ID:44338, to the nucleotide sequence of VGAM1048 RNA, herein designated VGAM RNA, also designated SEQ ID:3759.

[38495] Another function of VGAM1048 is therefore inhibition of KIAA0349 (Accession XM_166449). Accordingly, utilities of VGAM1048 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0349. KIAA1954 (Accession XM_085375) is another VGAM1048 host target gene. KIAA1954 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1954, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1954 BINDING SITE, designated SEQ ID:38097, to the nucleotide sequence of VGAM1048 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3759.

[38496] Another function of VGAM1048 is therefore inhibition of KIAA1954 (Accession XM_085375). Accordingly, utilities of VGAM1048 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1954. LOC148443 (Accession XM_086196) is another VGAM1048 host target gene. LOC148443 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC148443, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148443 BINDING SITE, designated SEQ ID:38538, to the nucleotide sequence of VGAM1048 RNA, herein designated VGAM RNA, also designated SEQ ID:3759.

[38497] Another function of VGAM1048 is therefore inhibition of LOC148443 (Accession XM_086196). Accordingly, utilities of VGAM1048 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148443. LOC149506 (Accession XM_097661) is another VGAM1048 host target gene. LOC149506 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149506, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149506 BINDING SITE, designated SEQ ID:41010, to the nucleotide sequence of VGAM1048 RNA, herein designated VGAM RNA, also designated SEQ ID:3759.

[38498] Another function of VGAM1048 is therefore inhibition of LOC149506 (Accession XM_097661). Accordingly, utilities of VGAM1048 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149506. LOC157556 (Accession XM_098783) is another VGAM1048 host target gene. LOC157556 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC157556, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157556 BINDING SITE, designated SEQ ID:41819, to the nucleotide sequence of VGAM1048 RNA, herein designated VGAM RNA, also designated SEQ ID:3759.

[38499] Another function of VGAM1048 is therefore inhibition of LOC157556 (Accession XM_098783). Accordingly, utilities of VGAM1048 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC157556. LOC203427 (Accession XM_114699) is another VGAM1048 host target gene. LOC203427 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC203427, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203427 BINDING SITE, designated SEQ ID:43043, to the nucleotide sequence of VGAM1048 RNA, herein designated VGAM RNA, also designated SEQ ID:3759.

[38500] Another function of VGAM1048 is therefore inhibition of LOC203427 (Accession XM_114699). Accordingly, utilities of VGAM1048 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203427. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1049 (VGAM1049) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[38501] VGAM1049 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1049 was detected is described hereinabove with reference to Figs. 1–8.

[38502] VGAM1049 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Strawberry Mild Yellow Edge Virus. VGAM1049 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[38503] VGAM1049 gene encodes a VGAM1049 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1049 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1049 precursor RNA is designated SEQ ID:1035, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1035 is located at position 4885 relative to the genome of Strawberry Mild Yellow Edge Virus.

[38504] VGAM1049 precursor RNA folds onto itself, forming VGAM1049 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by

miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[38505] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1049 folded precursor RNA into VGAM1049 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 47%) nucleotide sequence of VGAM1049 RNA is designated SEQ ID:3760, and is provided hereinbelow with reference to the sequence listing part.

[38506] VGAM1049 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1049 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1049 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[38507] VGAM1049 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1049 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1049 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1049 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1049 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[38508] The complementary binding of VGAM1049 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM1049 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1049 host target RNA into VGAM1049 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[38509] It is appreciated that VGAM1049 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1049 host target genes. The mRNA of each one of this plurality of VGAM1049 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1049 RNA, herein designated VGAM RNA, and which when bound by VGAM1049 RNA causes inhibition of translation of respective one or more VGAM1049 host target proteins.

[38510] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1049 gene, herein designated VGAM GENE, on one or more VGAM1049 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[38511] It is yet further appreciated that a function of VGAM1049 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1049 include diagnosis, prevention and treatment of viral infection by Strawberry Mild Yellow Edge Virus. Specific functions, and accordingly utilities, of VGAM1049 correlate with, and may be deduced from, the identity of the host target genes which VGAM1049 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[38512] Nucleotide sequences of the VGAM1049 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM1049 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1049 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1049 are further described hereinbelow with reference to Table 1.

[38513] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1049 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1049 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[38514] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1049 gene, herein designated VGAM is inhibition of expression of VGAM1049 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1049 correlate with, and may be deduced from, the identity of the target genes which VGAM1049 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[38515] Solute Carrier Family 39 (zinc transporter), Member 1 (SLC39A1, Accession NM_014437) is a VGAM1049 host target gene. SLC39A1 BINDING SITE is HOST TARGET

binding site found in the 3' untranslated region of mRNA encoded by SLC39A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC39A1 BINDING SITE, designated SEQ ID:15793, to the nucleotide sequence of VGAM1049 RNA, herein designated VGAM RNA, also designated SEQ ID:3760.

[38516] A function of VGAM1049 is therefore inhibition of Solute Carrier Family 39 (zinc transporter), Member 1 (SLC39A1, Accession NM_014437), a gene which is a divalent (zinc/iron) metal ion transporter. Accordingly, utilities of VGAM1049 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC39A1. The function of SLC39A1 has been established by previous studies. The ZRT- and IRT-related protein (ZIP) family is composed of divalent metal ion transporters, including *A. thaliana* IRT1 (iron-regulated transporter-1), which appears to play a role in iron uptake, and *S. cerevisiae* ZRT1 (zinc-regulated transporter-1) and ZRT2, and *A. thaliana* ZIP1 to ZIP4, all of which are probably zinc transporters (reviewed by Eng et al., 1998). The human growth arrest-inducible gene product (GAIP) is

also a ZIP family member based on sequence similarity. Lioumi et al. (1998) generated a transcript map of the region within and in the proximity of the epidermal differentiation complex (EDC; 601588), which is located in 1q21. They identified a partial ZIRTL cDNA as mapping to the distal end of the EDC, 200 kb from the S100A1 gene (OMIM Ref. No. 176940). Lioumi et al. (1998) found that a portion of the ZIRTL cDNA encodes a polypeptide with significant sequence similarity to the ZIP family of iron and zinc transporters from plants and yeast. By screening a human keratinocyte cDNA library with the partial ZIRTL cDNA, Lioumi et al. (1999) isolated a full-length ZIRTL cDNA. The predicted 324-amino acid ZIRTL protein contains 8 transmembrane domains, 9 possible N-myristylation sites, a potential protein kinase C phosphorylation site, and 4 potential protein kinase II phosphorylation sites. Human ZIRTL shares 21 to 22% amino acid sequence identity with *A. thaliana* IRT1 and ZIP1 to ZIP4, *Pisum sativum* Rit1, and *S. cerevisiae* ZRT1 and ZRT2. ZIRTL also shares 34% amino acid sequence identity with GAIP. The human and mouse Zirtl proteins are 90% similar. The ZIRTL gene contains 4 exons. Northern blot analysis detected a 2.1-kb ZIRTL transcript in all human tis-

sues tested, namely adult heart, lung, brain, liver, pancreas, small intestine, colon, kidney, spleen, thymus, peripheral blood leukocytes, skeletal muscle, testis, ovary, placenta, prostate, and keratinocytes, and fetal heart, kidney, small intestine, and skin. In situ hybridization showed that mouse Zirtl is developmentally regulated in the skin, where it was expressed in the epidermal layer, excluding the dermis, at E17.5, but not in embryonic days 10.5 and 15.5 or P21. In the small intestine, Zirtl was found toward the base of the intestinal villi from E17.5. In the pancreas, Zirtl expression was found from E17.5. Zirtl expression was not detected in the liver. Zirtl was expressed in osteoblasts of developing bone from E15.5 and in ameloblasts and odontoblasts at late stages of tooth development at P21. Moderate expression of Zirtl was observed in brain in the hippocampus

[38517] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[38518] Lioumi, M.; Ferguson, C. A.; Sharpe, P. T.; Freeman, T.; Marenholz, I.; Mischke, D.; Heizmann, C.; Ragoussis, J. : Isolation and characterization of human and mouse ZIRTL, a member of the IRT1 family of transporters, mapping

within the epidermal differentiation complex. Genomics 62: 272–280, 1999. ; and

[38519] Lioumi, M.; Olavesen, M. G.; Nizetic, D.; Ragoussis, J. : High-resolution YAC fragmentation map of 1q21. Genomics 49: 200–208, 1998.

[38520] Further studies establishing the function and utilities of SLC39A1 are found in John Hopkins OMIM database record ID 604740, and in cited publications numbered 6744–6746 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Spastic Paraplegia 4 (autosomal dominant; spastin) (SPG4, Accession NM_014946) is another VGAM1049 host target gene. SPG4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SPG4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SPG4 BINDING SITE, designated SEQ ID:17261, to the nucleotide sequence of VGAM1049 RNA, herein designated VGAM RNA, also designated SEQ ID:3760.

[38521] Another function of VGAM1049 is therefore inhibition of Spastic Paraplegia 4 (autosomal dominant; spastin) (SPG4, Accession NM_014946), a gene which is probably an AT–

Pase involved in the assembly or function of nuclear protein complexes. Accordingly, utilities of VGAM1049 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SPG4. The function of SPG4 has been established by previous studies. SPG4 is ubiquitously expressed in human adult and fetal tissue, showing slightly higher expression in fetal brain. Hazan et al. (1999) cloned the mouse ortholog of SPG4, which between amino acids 113 and 616 has 96% identity with human SPG4. Spg4 transcripts are ubiquitously expressed in adult tissues and from embryonic day 7 to 17 in mouse. Interaction with the cytoskeleton was mediated by the N-terminal region of spastin and was regulated through the ATPase activity of the AAA domain. Expression of missense mutations (including 604277.0001, 604277.0002, and 604277.0004) into the AAA domain led to constitutive binding to microtubules in transfected cells and induced the disappearance of the aster and the formation of thick perinuclear bundles, suggesting a role of spastin in microtubule dynamics. Consistently, wildtype spastin promoted microtubule disassembly in transfected cells. The authors suggested that spastin may be involved in microtubule dynamics similarly to the highly homologous mi-

crotubule-severing protein katanin (OMIM Ref. No. 606696). The authors hypothesized that impairment of fine regulation of the microtubule cytoskeleton in long axons, due to spastin mutations, may underlie the pathogenesis of hereditary spastic paraplegia

[38522] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[38523] Hazan, J.; Fonknechten, N.; Mavel, D.; Paternotte, C.; Samson, D.; Artiguenave, F.; Davoine, C.-S.; Cruaud, C.; Durr, A.; Wincker, P.; Brottier, P.; Cattolico, L.; Barbe, V.; Burgunder, J.-M.; Prud'homme, J.-F.; Brice, A.; Fontaine, B.; Heilig, R.; Weissenbach, J. : Spastin, a new AAA protein, is altered in the most frequent form of autosomal dominant spastic paraplegia. *Nature Genet.* 23: 296-303, 1999. ; and

[38524] Errico, A.; Ballabio, A.; Rugarli, E. I. : Spastin, the protein mutated in autosomal dominant hereditary spastic paraplegia, is involved in microtubule dynamics. *Hum. Molec. Genet.* 11: 153.

[38525] Further studies establishing the function and utilities of SPG4 are found in John Hopkins OMIM database record ID 604277, and in cited publications numbered

10496–7390, 10497–7396, 7391, 10498–761 and 10499 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. DKFZP434A043 (Accession NM_015396) is another VGAM1049 host target gene. DKFZP434A043 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP434A043, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434A043 BINDING SITE, designated SEQ ID:17702, to the nucleotide sequence of VGAM1049 RNA, herein designated VGAM RNA, also designated SEQ ID:3760.

[38526] Another function of VGAM1049 is therefore inhibition of DKFZP434A043 (Accession NM_015396). Accordingly, utilities of VGAM1049 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434A043. FLJ12526 (Accession NM_024787) is another VGAM1049 host target gene. FLJ12526 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ12526, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of FLJ12526 BINDING SITE, designated SEQ ID:24168, to the nucleotide sequence of VGAM1049 RNA, herein designated VGAM RNA, also designated SEQ ID:3760.

[38527] Another function of VGAM1049 is therefore inhibition of FLJ12526 (Accession NM_024787). Accordingly, utilities of VGAM1049 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12526. KIAA0513 (Accession NM_014732) is another VGAM1049 host target gene. KIAA0513 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0513, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0513 BINDING SITE, designated SEQ ID:16358, to the nucleotide sequence of VGAM1049 RNA, herein designated VGAM RNA, also designated SEQ ID:3760.

[38528] Another function of VGAM1049 is therefore inhibition of KIAA0513 (Accession NM_014732). Accordingly, utilities of VGAM1049 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0513. Placenta-specific 3 (PLAC3, Accession

XM_045115) is another VGAM1049 host target gene.

PLAC3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PLAC3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLAC3 BINDING SITE, designated SEQ ID:34366, to the nucleotide sequence of VGAM1049 RNA, herein designated VGAM RNA, also designated SEQ ID:3760.

[38529] Another function of VGAM1049 is therefore inhibition of Placenta-specific 3 (PLAC3, Accession XM_045115). Accordingly, utilities of VGAM1049 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLAC3. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1050 (VGAM1050) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[38530] VGAM1050 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM1050 was detected is described hereinabove with reference to Figs. 1–8.

[38531] VGAM1050 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Meleagrid Herpesvirus 1. VGAM1050 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[38532] VGAM1050 gene encodes a VGAM1050 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1050 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1050 precursor RNA is designated SEQ ID:1036, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1036 is located at position 108185 relative to the genome of Meleagrid Herpesvirus 1.

[38533] VGAM1050 precursor RNA folds onto itself, forming VGAM1050 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide

sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[38534] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1050 folded precursor RNA into VGAM1050 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM1050 RNA is designated SEQ ID:3761, and is provided hereinbelow with reference to the sequence listing part.

[38535] VGAM1050 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1050 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1050 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[38536] VGAM1050 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM1050 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1050 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1050 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1050 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[38537] The complementary binding of VGAM1050 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM1050 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1050 host target RNA into VGAM1050 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[38538] It is appreciated that VGAM1050 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1050 host target genes. The mRNA of each one of this plurality of VGAM1050 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1050 RNA, herein designated VGAM RNA, and which when bound by VGAM1050 RNA causes inhibition of translation of respective one or more VGAM1050 host target proteins.

[38539] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1050 gene, herein designated VGAM GENE, on one or more VGAM1050 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[38540] It is yet further appreciated that a function of VGAM1050 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1050 include diagnosis, prevention and treatment of viral infection by Meleagrid Herpesvirus 1. Specific functions, and accordingly utilities, of VGAM1050 correlate with, and may be deduced from, the identity of the host target genes which VGAM1050 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[38541] Nucleotide sequences of the VGAM1050 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1050 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM1050 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1050 are further described hereinbelow with reference to Table 1.

[38542] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1050 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1050 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[38543] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1050 gene, herein designated VGAM is inhibition of expression of VGAM1050 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1050 correlate with, and may be deduced from, the identity of the target genes which VGAM1050 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[38544] ADP-ribosylation Factor-like 4 (ARL4, Accession NM_005738) is a VGAM1050 host target gene. ARL4 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ARL4, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARL4 BINDING SITE, designated SEQ ID:12298, to the nucleotide sequence of VGAM1050 RNA, herein designated VGAM RNA, also designated SEQ ID:3761.

[38545] A function of VGAM1050 is therefore inhibition of ADP-ribosylation Factor-like 4 (ARL4, Accession NM_005738), a gene which may be required for the progression of cells through meiosis. Accordingly, utilities of VGAM1050 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARL4. The function of ARL4 has been established by previous studies. Schurmann et al. (1994) identified mouse *Arl4* as a gene that is abundantly expressed in differentiated cells of the preadipocyte cell line 3T3-L1 but is not detectably expressed in undifferentiated 3T3-L1 cells. By Northern blot analysis, Jacobs et al. (1998) found that rat *Arl4* is expressed predominantly in testis, at lower levels in spleen and intestine, and at even lower levels in brain, heart, total fat, liver, lung, and thymus. In situ hybridization of rat testis showed that *Arl4* is expressed in germ cells of puberal and adult testis, but not in prepuberal testis. Jacobs

et al. (1998) suggested that Arl4 is involved in sperm production. Animal model experiments lend further support to the function of ARL4. Schurmann et al. (2002) generated mice lacking Arl4. These mice did not have upregulated expression of other Arl genes in testis, were viable, and were apparently normal except for reduced testicular weight and sperm count. However, the remaining sperm had normal motility, and Arl4 $-/-$ mice were fertile and sired normal-size litters. Schurmann et al. (2002) proposed that ARL4 is required for the progression of cells through meiosis and that its deletion causes a retardation of the formation of haploid spermatides

[38546] It is appreciated that the abovementioned animal model for ARL4 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[38547] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[38548] Schurmann, A.; Breiner, M.; Becker, W.; Huppertz, C.; Kainulainen, H.; Kentrup, H.; Joost, H.-G. : Cloning of two novel ADP-ribosylation factor-like proteins and characterization of their differential expression in 3T3-L1 cells. J.

Biol. Chem. 269: 15683–15688, 1994. ; and

[38549] Schurmann, A.; Koling, S.; Jacobs, S.; Saftig, P.; Kraub, S.; Wennemuth, G.; Kluge, R.; Joost, H.–G. : Reduced sperm count and normal fertility in male mice with targeted disruption of.

[38550] Further studies establishing the function and utilities of ARL4 are found in John Hopkins OMIM database record ID 604786, and in cited publications numbered 665 and 7445–2905 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. GEMIN5 (Accession XM_114471) is another VGAM1050 host target gene. GEMIN5 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by GEMIN5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GEMIN5 BINDING SITE, designated SEQ ID:42971, to the nucleotide sequence of VGAM1050 RNA, herein designated VGAM RNA, also designated SEQ ID:3761.

[38551] Another function of VGAM1050 is therefore inhibition of GEMIN5 (Accession XM_114471). Accordingly, utilities of VGAM1050 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with GEMIN5. MAP-kinase Activating Death Domain (MADD, Accession NM_130476) is another VGAM1050 host target gene. MADD BINDING SITE1 through MADD BINDING SITE6 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by MADD, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MADD BINDING SITE1 through MADD BINDING SITE6, designated SEQ ID:28254, SEQ ID:28239, SEQ ID:28233, SEQ ID:9784, SEQ ID:28249 and SEQ ID:28244 respectively, to the nucleotide sequence of VGAM1050 RNA, herein designated VGAM RNA, also designated SEQ ID:3761.

[38552] Another function of VGAM1050 is therefore inhibition of MAP-kinase Activating Death Domain (MADD, Accession NM_130476), a gene which may regulate two different pathways for neural activities.interacts with the type-1 tumor necrosis factor receptor (TNFR1); death domain-containing protein. Accordingly, utilities of VGAM1050 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MADD. The function of MADD and its association with various diseases and clini-

cal conditions, has been established by previous studies, as described hereinabove with reference to VGAM430.Solute Carrier Family 4, Sodium Bicarbonate Cotransporter, Member 7 (SLC4A7, Accession NM_003615) is another VGAM1050 host target gene. SLC4A7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC4A7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC4A7 BINDING SITE, designated SEQ ID:9666, to the nucleotide sequence of VGAM1050 RNA, herein designated VGAM RNA, also designated SEQ ID:3761.

[38553] Another function of VGAM1050 is therefore inhibition of Solute Carrier Family 4, Sodium Bicarbonate Cotransporter, Member 7 (SLC4A7, Accession NM_003615), a gene which mediates the coupled movement of sodium and bicarbonate ions across the plasma membrane. Accordingly, utilities of VGAM1050 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC4A7. The function of SLC4A7 and its association with various diseases and clinical conditions,

has been established by previous studies, as described hereinabove with reference to VGAM66. Chromosome 1 Open Reading Frame 16 (C1orf16, Accession NM_014837) is another VGAM1050 host target gene. C1orf16 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C1orf16, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C1orf16 BINDING SITE, designated SEQ ID:16853, to the nucleotide sequence of VGAM1050 RNA, herein designated VGAM RNA, also designated SEQ ID:3761.

[38554] Another function of VGAM1050 is therefore inhibition of Chromosome 1 Open Reading Frame 16 (C1orf16, Accession NM_014837). Accordingly, utilities of VGAM1050 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1orf16. LOC113612 (Accession XM_054492) is another VGAM1050 host target gene. LOC113612 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC113612, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nu-

cleotide sequences of LOC113612 BINDING SITE, designated SEQ ID:36171, to the nucleotide sequence of VGAM1050 RNA, herein designated VGAM RNA, also designated SEQ ID:3761.

[38555] Another function of VGAM1050 is therefore inhibition of LOC113612 (Accession XM_054492). Accordingly, utilities of VGAM1050 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC113612. LOC199920 (Accession XM_114056) is another VGAM1050 host target gene. LOC199920 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC199920, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199920 BINDING SITE, designated SEQ ID:42659, to the nucleotide sequence of VGAM1050 RNA, herein designated VGAM RNA, also designated SEQ ID:3761.

[38556] Another function of VGAM1050 is therefore inhibition of LOC199920 (Accession XM_114056). Accordingly, utilities of VGAM1050 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199920. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1051 (VGAM1051) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[38557] VGAM1051 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1051 was detected is described hereinabove with reference to Figs. 1–8.

[38558] VGAM1051 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Meleagrid Herpesvirus 1. VGAM1051 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[38559] VGAM1051 gene encodes a VGAM1051 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1051 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1051 precursor RNA is designated SEQ ID:1037, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence

SEQ ID:1037 is located at position 110396 relative to the genome of Meleagrid Herpesvirus 1.

[38560] VGAM1051 precursor RNA folds onto itself, forming VGAM1051 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[38561] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1051 folded precursor RNA into VGAM1051 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1051 RNA is designated SEQ ID:3762, and is provided hereinbelow with reference to the sequence listing part.

[38562] VGAM1051 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1051 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1051 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[38563] VGAM1051 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1051 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1051 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1051 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1051 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[38564] The complementary binding of VGAM1051 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1051 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1051 host target RNA into VGAM1051 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[38565] It is appreciated that VGAM1051 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1051 host target genes. The mRNA of each one of this plurality of VGAM1051 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1051 RNA, herein designated VGAM RNA, and which when bound by VGAM1051 RNA causes inhibition of translation of respective one or more

VGAM1051 host target proteins.

[38566] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1051 gene, herein designated VGAM GENE, on one or more VGAM1051 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[38567] It is yet further appreciated that a function of VGAM1051 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1051 include diagnosis, prevention and treatment of viral infection by Meleagrid Herpesvirus 1.

Specific functions, and accordingly utilities, of VGAM1051 correlate with, and may be deduced from, the identity of the host target genes which VGAM1051 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[38568] Nucleotide sequences of the VGAM1051 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1051 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1051 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1051 are further described hereinbelow with reference to Table 1.

[38569] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1051 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1051 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[38570] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1051 gene, herein designated VGAM is inhibition of expression of VGAM1051 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM1051 correlate with, and may be deduced from, the identity of the target genes which VGAM1051 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[38571] Flavin Containing Monooxygenase 5 (FMO5, Accession NM_001461) is a VGAM1051 host target gene. FMO5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FMO5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FMO5 BINDING SITE, designated SEQ ID:7193, to the nucleotide sequence of VGAM1051 RNA, herein designated VGAM RNA, also designated SEQ ID:3762.

[38572] A function of VGAM1051 is therefore inhibition of Flavin Containing Monooxygenase 5 (FMO5, Accession NM_001461), a gene which Flavin-containing monooxygenase 5; may catalyze the monooxygenation of xenobiotic soft nucleophiles. Accordingly, utilities of VGAM1051 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FMO5. The function of FMO5 has been established by previous studies. The flavin-containing monooxygenases (FMOs; EC

1.14.13.8) catalyze the oxidation of nucleophilic nitrogen, sulfur, and phosphorus atoms in a wide variety of compounds, including many pesticides and drugs. See FMO1 (OMIM Ref. No. 136130). By screening liver libraries with a rabbit FMO5 cDNA, Overby et al. (1995) isolated cDNAs encoding guinea pig and human FMO5. The predicted 533-amino acid human protein shares 85% and 87% identity with rabbit and guinea pig FMO5, respectively. Northern blot analysis revealed that the human FMO5 gene was expressed as 2.6- and 3.8-kb mRNAs in liver. The FMO5 protein had an apparent molecular mass of 60 kD on Western blots of adult and neonatal human liver. All 3 mammalian FMO5 enzymes exhibited similar catalytic activities, which were distinct from those of other FMOs. The authors concluded that FMO5 is not an efficient drug-metabolizing enzyme and that it may have an alternative physiologic role. By PCR analysis of somatic cell hybrids, McCombie et al. (1996) mapped the FMO2 (OMIM Ref. No. 603955) and FMO5 genes to chromosome 1q, where 3 other human FMO genes are located. Using sequence analysis of a YAC contig, Gelb et al. (1997) found that the FMO5 gene is located between the NPR1 (OMIM Ref. No. 108960) and CX40 (GJA5; 121013) genes. By FISH, they

mapped this contig to 1q21.1. Gelb et al. (1997) noted that since the FMO1 gene maps to 1q23–q25, this excluded the possibility that a single gene cluster contains the entire FMO family.

[38573] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[38574] McCombie, R. R.; Dolphin, C. T.; Povey, S.; Phillips, I. R.; Shephard, E. A. : Localization of human flavin-containing monooxygenase genes FMO2 and FMO5 to chromosome 1q. *Genomics* 34: 426–429, 1996. ; and

[38575] Overby, L. H.; Buckpitt, A. R.; Lawton, M. P.; Atta-Asafo-Adjei, E.; Schulze, J.; Philpot, R. M. : Characterization of flavin-containing monooxygenase 5 (FMO5) cloned from human and gui.

[38576] Further studies establishing the function and utilities of FMO5 are found in John Hopkins OMIM database record ID 603957, and in cited publications numbered 528 and 5285 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Tripartite Motif-containing 6 (TRIM6, Accession NM_058166) is another VGAM1051 host target gene. TRIM6 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region

of mRNA encoded by TRIM6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRIM6 BINDING SITE, designated SEQ ID:27713, to the nucleotide sequence of VGAM1051 RNA, herein designated VGAM RNA, also designated SEQ ID:3762.

[38577] Another function of VGAM1051 is therefore inhibition of Tripartite Motif-containing 6 (TRIM6, Accession NM_058166). Accordingly, utilities of VGAM1051 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIM6. LOC152059 (Accession XM_087372) is another VGAM1051 host target gene. LOC152059 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152059, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152059 BINDING SITE, designated SEQ ID:39209, to the nucleotide sequence of VGAM1051 RNA, herein designated VGAM RNA, also designated SEQ ID:3762.

[38578] Another function of VGAM1051 is therefore inhibition of

LOC152059 (Accession XM_087372). Accordingly, utilities of VGAM1051 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152059. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1052 (VGAM1052) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[38579] VGAM1052 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1052 was detected is described hereinabove with reference to Figs. 1-8.

[38580] VGAM1052 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Meleagrid Herpesvirus 1. VGAM1052 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[38581] VGAM1052 gene encodes a VGAM1052 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1052 precursor RNA does not encode a protein. A

nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1052 precursor RNA is designated SEQ ID:1038, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1038 is located at position 106911 relative to the genome of Meleagrid Herpesvirus 1.

- [38582] VGAM1052 precursor RNA folds onto itself, forming VGAM1052 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [38583] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1052 folded precursor RNA into VGAM1052 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide se-

quence of VGAM1052 RNA is designated SEQ ID:3763, and is provided hereinbelow with reference to the sequence listing part.

[38584] VGAM1052 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1052 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1052 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[38585] VGAM1052 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1052 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1052 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting – VGAM1052 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1052 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[38586] The complementary binding of VGAM1052 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1052 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1052 host target RNA into VGAM1052 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[38587] It is appreciated that VGAM1052 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1052 host target genes. The mRNA of each one of this plurality of VGAM1052 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM1052 RNA, herein designated VGAM RNA, and which when bound by VGAM1052 RNA causes inhibition of translation of respective one or more VGAM1052 host target proteins.

[38588] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1052 gene, herein designated VGAM GENE, on one or more VGAM1052 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[38589] It is yet further appreciated that a function of VGAM1052

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1052 include diagnosis, prevention and treatment of viral infection by Meleagrid Herpesvirus 1. Specific functions, and accordingly utilities, of VGAM1052 correlate with, and may be deduced from, the identity of the host target genes which VGAM1052 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[38590] Nucleotide sequences of the VGAM1052 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1052 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1052 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1052 are further described hereinbelow with reference to Table 1.

[38591] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1052 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1052 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[38592] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1052 gene, herein designated VGAM is inhibition of expression of VGAM1052 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1052 correlate with, and may be deduced from, the identity of the target genes which VGAM1052 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[38593] Bromodomain and PHD Finger Containing, 1 (BRPF1, Accession XM_054520) is a VGAM1052 host target gene. BRPF1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BRPF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BRPF1 BINDING SITE, designated SEQ ID:36172, to the nucleotide sequence of VGAM1052 RNA, herein designated VGAM RNA, also designated SEQ ID:3763.

[38594] A function of VGAM1052 is therefore inhibition of Bromodomain and PHD Finger Containing, 1 (BRPF1, Accession XM_054520), a gene which has 6 zinc finger motifs and a bromodomain. Accordingly, utilities of VGAM1052

include diagnosis, prevention and treatment of diseases and clinical conditions associated with BRPF1. The function of BRPF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM497. Caspase 8, Apoptosis-related Cysteine Protease (CASP8, Accession NM_033355) is another VGAM1052 host target gene. CASP8 BINDING SITE1 and CASP8 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by CASP8, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CASP8 BINDING SITE1 and CASP8 BINDING SITE2, designated SEQ ID:27202 and SEQ ID:27206 respectively, to the nucleotide sequence of VGAM1052 RNA, herein designated VGAM RNA, also designated SEQ ID:3763.

[38595] Another function of VGAM1052 is therefore inhibition of Caspase 8, Apoptosis-related Cysteine Protease (CASP8, Accession NM_033355), a gene which is an apoptosis-related caspase and an upstream component of Fas receptor and tumor necrosis factor (TNF) receptor-induced apoptosis. Accordingly, utilities of VGAM1052 include diagno-

sis, prevention and treatment of diseases and clinical conditions associated with CASP8. The function of CASP8 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM145. DNA Fragmentation Factor, 40kDa, Beta Polypeptide (caspase-activated DNase) (DFFB, Accession XM_113366) is another VGAM1052 host target gene. DFFB BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DFFB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DFFB BINDING SITE, designated SEQ ID:42240, to the nucleotide sequence of VGAM1052 RNA, herein designated VGAM RNA, also designated SEQ ID:3763.

[38596] Another function of VGAM1052 is therefore inhibition of DNA Fragmentation Factor, 40kDa, Beta Polypeptide (caspase-activated DNase) (DFFB, Accession XM_113366), a gene which induces DNA fragmentation and chromatin condensation during apoptosis. Accordingly, utilities of VGAM1052 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DFFB.

The function of DFFB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM74. Thyroid Autoantigen 70kDa (Ku antigen) (G22P1, Accession NM_001469) is another VGAM1052 host target gene. G22P1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by G22P1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of G22P1 BINDING SITE, designated SEQ ID:7202, to the nucleotide sequence of VGAM1052 RNA, herein designated VGAM RNA, also designated SEQ ID:3763.

[38597] Another function of VGAM1052 is therefore inhibition of Thyroid Autoantigen 70kDa (Ku antigen) (G22P1, Accession NM_001469), a gene which has a role in chromosome translocation. Accordingly, utilities of VGAM1052 include diagnosis, prevention and treatment of diseases and clinical conditions associated with G22P1. The function of G22P1 has been established by previous studies. The G22P1 gene encodes subunit p70 of the p70/p80 autoantigen. The p70/p80 autoantigen consists of 2 pro-

teins of molecular mass of approximately 70,000 and 80,000 daltons that dimerize to form a 10 S DNA-binding complex. See 194364 for discussion of the gene encoding the p80 subunit. Exchange of immunologic reagents showed that the p70/p80 autoantigen is identical to the Ku antigen, the Ki antigen, and the 86- to 70-kD protein complex. The p70/p80 complex binds to the ends of double-stranded DNA in a cell cycle-dependent manner, being associated with chromosomes of interphase cells, followed by complete dissociation from the condensing chromosomes in early prophase. Both p70 and p80 contain phosphoserine residues. A role for the antigen in DNA repair or transposition has been proposed. Animal model experiments lend further support to the function of G22P1. Li et al. (1998) presented evidence that inactivation of the Ku70 gene by targeted disruption in mice and derived cell lines leads to a propensity for malignant transformation both in vitro and in vivo. In vitro, Ku70 $-/-$ mouse fibroblasts displayed an increased rate of sister chromatid exchange and a high frequency of spontaneous neoplastic transformation. In vivo, Ku70 $-/-$ mice, known to be defective in B- but not T-lymphocyte maturation, developed thymic and disseminated T-cell lymphomas at

a mean age of 6 months with CD4+ /CD8+ tumor cells. In addition, many of the knockout mice showed segmental aganglionosis affecting the small intestine and the colon. These findings demonstrated that Ku70 deficiency facilitates neoplastic growth and suggested a role of the Ku70 locus in tumor suppression.

[38598] It is appreciated that the abovementioned animal model for G22P1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[38599] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[38600] Li, G. C.; Ouyang, H.; Li, X.; Nagasawa, H.; Little, J. B.; Chen, D. J.; Ling, C. C.; Fuks, Z.; Cordon-Cardo, C. : Ku70: a candidate tumor suppressor gene for murine T cell lymphoma. *Molec. Cell* 2: 1-8, 1998. ; and

[38601] Reeves, W. H.; Sthoeger, Z. M. : Molecular cloning of cDNA encoding the p70 (Ku) lupus autoantigen. *J. Biol. Chem.* 264: 5047-5052, 1989.

[38602] Further studies establishing the function and utilities of G22P1 are found in John Hopkins OMIM database record ID 152690, and in cited publications numbered 88 and

1828–1840 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Glutamate Receptor, Metabotropic 4 (GRM4, Accession NM_000841) is another VGAM1052 host target gene. GRM4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GRM4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GRM4 BINDING SITE, designated SEQ ID:6503, to the nucleotide sequence of VGAM1052 RNA, herein designated VGAM RNA, also designated SEQ ID:3763.

[38603] Another function of VGAM1052 is therefore inhibition of Glutamate Receptor, Metabotropic 4 (GRM4, Accession NM_000841), a gene which is mediated by a g-protein that inhibits adenylate cyclase activity. Accordingly, utilities of VGAM1052 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GRM4. The function of GRM4 has been established by previous studies. L-glutamate is the major excitatory neurotransmitter in the central nervous system and activates both ionotropic and metabotropic glutamate receptors. See mGluR3 (OMIM Ref. No. 601115). The metabotropic

glutamate receptors (OMIM Ref. No. mGluRs), which are G protein-coupled receptors, have been divided into 3 groups on the basis of sequence homology, putative signal transduction mechanisms, and pharmacologic properties. Group II and group III mGluRs are linked to the inhibition of the cyclic AMP cascade, but differ in their agonist selectivities. Group III agonists include L-2-amino-4-phosphonobutyrate (L-AP4) and L-serine-O-phosphate (Wu et al., 1998). Animal model experiments lend further support to the function of GRM4. To provide a better understanding of the L-AP4 receptors, Pekhletski et al. (1996) generated knockout mice lacking the mGluR4 gene. The mutant mice did not display any gross motor abnormalities, impairments of novelty-induced exploratory behaviors, or alterations in fine motor coordination. However, they were deficient on the rotating rod motor-learning test, suggesting that they may have an impaired ability to learn complex motor tasks. Analysis of presynaptic short-term synaptic plasticity at the parallel fiber-Purkinje cell synapse demonstrated that paired-pulse facilitation and post-tetanic potentiation were impaired in the mutant mice, although long-term depression was unaffected. Pekhletski et al. (1996) concluded that an

important function of mGluR4 is to provide a presynaptic mechanism for maintaining synaptic efficacy during repetitive activation, and that the presence of mGluR4 at the parallel fiber–Purkinje cell synapse is required for maintaining normal motor function. Gerlai et al. (1998) found that mGluR4 mutant mice exhibited significantly accelerated learning performance in a spatial reversal learning task. In a probe trial administered 6 weeks post-training, the mice showed impaired spatial accuracy. These results suggested that mGluR4 mutant mice differ in their ability to learn and integrate new spatial information into previously formed memory traces and that their use of stored spatial information is altered.

[38604] It is appreciated that the abovementioned animal model for GRM4 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[38605] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[38606] Pekhletski, R.; Gerlai, R.; Overstreet, L. S.; Huang, X. P.; Agopyan, N.; Slater, N. T.; Abramow–Newerly, W.; Roder, J. C.; Hampson, D. R. : Impaired cerebellar synaptic plasticity

and motor performance in mice lacking the mGluR4 subtype of metabotropic glutamate receptor. J. Neurosci. 16: 6364–6373, 1996. ; and

[38607] Wu, S.; Wright, R. A.; Rockey, P. K.; Burgett, S. G.; Arnold, J. S.; Rosteck, P. R., Jr.; Johnson, B. G.; Schoepp, D. D.; Belagaje, R. M. : Group III human metabotropic glutamate recepto.

[38608] Further studies establishing the function and utilities of GRM4 are found in John Hopkins OMIM database record ID 604100, and in cited publications numbered 5436, 5844–504 and 6361 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. 5-hydroxytryptamine (serotonin) Receptor 2C (HTR2C, Accession NM_000868) is another VGAM1052 host target gene. HTR2C BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by HTR2C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HTR2C BINDING SITE, designated SEQ ID:6533, to the nucleotide sequence of VGAM1052 RNA, herein designated VGAM RNA, also designated SEQ ID:3763.

[38609] Another function of VGAM1052 is therefore inhibition of 5-hydroxytryptamine (serotonin) Receptor 2C (HTR2C, Accession NM_000868), a gene which activates phospholipase C and regulates intracellular calcium flux. Accordingly, utilities of VGAM1052 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HTR2C. The function of HTR2C has been established by previous studies. Hall (1947) found that DBA/2 mice exhibited genetic susceptibility to audiogenic seizures (AGSs) stimulated by a doorbell mounted in an iron tub. Thereafter, audiogenic seizures were among the intensively studied phenotypes in behavioral genetics. Brennan et al. (1997) found that null mutant mice lacking serotonin 5-HT_{2C} receptors are extremely susceptible to AGSs. The onset of susceptibility was between 2 and 3 months of age, with complete penetrance in adult animals. Heisler et al. (2002) hypothesized that 5-HT receptors are expressed in POMC (OMIM Ref. No. 176830) neurons and that action at these receptors mediates a component of the anorexic effect of d-FEN (D-fenfluramine). Heisler et al. (2002) found that up to 80% of alpha-MSH neurons express HTR2C mRNA and that the pattern of co-expression was greatest in the caudal arcuate nucleus of

the hypothalamus. Heisler et al. (2002) demonstrated that direct activation of HTR2C by agonist in rats decreased their food intake and showed increased induction of FOS-like immunoreactivity in a pattern persistent with d-FEN-induced FOS-like immunoreactivity expression in the arcuate nucleus and paraventricular nucleus of the hypothalamus. Heisler et al. (2002) demonstrated that d-FEN directly activates POMC neurons, indicating that central 5-HT systems directly activate POMC neurons.

[38610] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[38611] Heisler, L. K.; Cowley, M. A.; Tecott, L. H.; Fan, W.; Low, M. J.; Smart, J. L.; Rubinstein, M.; Tatro, J. B.; Marcus, J. N.; Holstege, H.; Lee, C. E.; Cone, R. D.; Elmquist, J. K. : Activation of central melanocortin pathways by fenfluramine. *Science* 297: 609–611, 2002. ; and

[38613] Further studies establishing the function and utilities of HTR2C are found in John Hopkins OMIM database record

ID 312861, and in cited publications numbered 10618–1062 and 11464–10623 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Kelch-like 1 (Drosophila) (KLHL1, Accession NM_020866) is another VGAM1052 host target gene. KLHL1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KLHL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KLHL1 BINDING SITE, designated SEQ ID:21918, to the nucleotide sequence of VGAM1052 RNA, herein designated VGAM RNA, also designated SEQ ID:3763.

[38614] Another function of VGAM1052 is therefore inhibition of Kelch-like 1 (Drosophila) (KLHL1, Accession NM_020866). Accordingly, utilities of VGAM1052 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KLHL1. LIM Homeobox Protein 2 (LHX2, Accession NM_004789) is another VGAM1052 host target gene. LHX2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LHX2, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LHX2 BINDING SITE, designated SEQ ID:11199, to the nucleotide sequence of VGAM1052 RNA, herein designated VGAM RNA, also designated SEQ ID:3763.

[38615] Another function of VGAM1052 is therefore inhibition of LIM Homeobox Protein 2 (LHX2, Accession NM_004789). Accordingly, utilities of VGAM1052 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LHX2. NIMA (never in mitosis gene a)-related Kinase 4 (NEK4, Accession NM_003157) is another VGAM1052 host target gene. NEK4 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by NEK4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NEK4 BINDING SITE, designated SEQ ID:9137, to the nucleotide sequence of VGAM1052 RNA, herein designated VGAM RNA, also designated SEQ ID:3763.

[38616] Another function of VGAM1052 is therefore inhibition of NIMA (never in mitosis gene a)-related Kinase 4 (NEK4,

Accession NM_003157). Accordingly, utilities of VGAM1052 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NEK4. Synaptogyrin 1 (SYNGR1, Accession NM_004711) is another VGAM1052 host target gene. SYNGR1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SYNGR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SYNGR1 BINDING SITE, designated SEQ ID:11062, to the nucleotide sequence of VGAM1052 RNA, herein designated VGAM RNA, also designated SEQ ID:3763.

[38617] Another function of VGAM1052 is therefore inhibition of Synaptogyrin 1 (SYNGR1, Accession NM_004711), a gene which belongs to transmembrane synaptic vesicle protein and may function in membrane recycling. Accordingly, utilities of VGAM1052 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SYNGR1. The function of SYNGR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM107. ADP-ribosylation Factor GT-

Pase Activating Protein 1 (ARFGAP1, Accession NM_018209) is another VGAM1052 host target gene. ARFGAP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ARFGAP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARFGAP1 BINDING SITE, designated SEQ ID:20109, to the nucleotide sequence of VGAM1052 RNA, herein designated VGAM RNA, also designated SEQ ID:3763.

[38618] Another function of VGAM1052 is therefore inhibition of ADP-ribosylation Factor GTPase Activating Protein 1 (ARFGAP1, Accession NM_018209). Accordingly, utilities of VGAM1052 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARFGAP1. Chromosome 20 Open Reading Frame 124 (C20orf124, Accession NM_024777) is another VGAM1052 host target gene. C20orf124 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C20orf124, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of C20orf124 BINDING SITE, designated SEQ ID:24144, to the nucleotide sequence of VGAM1052 RNA, herein designated VGAM RNA, also designated SEQ ID:3763.

[38619] Another function of VGAM1052 is therefore inhibition of Chromosome 20 Open Reading Frame 124 (C20orf124, Accession NM_024777). Accordingly, utilities of VGAM1052 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf124. CG012 (Accession XM_096710) is another VGAM1052 host target gene. CG012 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CG012, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CG012 BINDING SITE, designated SEQ ID:40486, to the nucleotide sequence of VGAM1052 RNA, herein designated VGAM RNA, also designated SEQ ID:3763.

[38620] Another function of VGAM1052 is therefore inhibition of CG012 (Accession XM_096710). Accordingly, utilities of VGAM1052 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CG012.

DJ667H12.2 (Accession NM_019605) is another VGAM1052 host target gene. DJ667H12.2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DJ667H12.2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DJ667H12.2 BINDING SITE, designated SEQ ID:21215, to the nucleotide sequence of VGAM1052 RNA, herein designated VGAM RNA, also designated SEQ ID:3763.

[38621] Another function of VGAM1052 is therefore inhibition of DJ667H12.2 (Accession NM_019605). Accordingly, utilities of VGAM1052 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DJ667H12.2. Dystrophia Myotonica-containing WD Repeat Motif (DMWD, Accession XM_027569) is another VGAM1052 host target gene. DMWD BINDING SITE1 and DMWD BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by DMWD, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DMWD BINDING SITE1 and DMWD BINDING

SITE2, designated SEQ ID:30528 and SEQ ID:30530 respectively, to the nucleotide sequence of VGAM1052 RNA, herein designated VGAM RNA, also designated SEQ ID:3763.

[38622] Another function of VGAM1052 is therefore inhibition of Dystrophia Myotonica-containing WD Repeat Motif (DMWD, Accession XM_027569). Accordingly, utilities of VGAM1052 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DMWD. FLJ10661 (Accession NM_018172) is another VGAM1052 host target gene. FLJ10661 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10661, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10661 BINDING SITE, designated SEQ ID:19994, to the nucleotide sequence of VGAM1052 RNA, herein designated VGAM RNA, also designated SEQ ID:3763.

[38623] Another function of VGAM1052 is therefore inhibition of FLJ10661 (Accession NM_018172). Accordingly, utilities of VGAM1052 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

FLJ10661. FLJ12650 (Accession NM_024522) is another VGAM1052 host target gene. FLJ12650 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12650, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12650 BINDING SITE, designated SEQ ID:23722, to the nucleotide sequence of VGAM1052 RNA, herein designated VGAM RNA, also designated SEQ ID:3763.

[38624] Another function of VGAM1052 is therefore inhibition of FLJ12650 (Accession NM_024522). Accordingly, utilities of VGAM1052 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12650. KIAA0356 (Accession XM_038655) is another VGAM1052 host target gene. KIAA0356 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0356, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0356 BINDING SITE, designated SEQ ID:32891, to the nucleotide sequence of VGAM1052 RNA, herein design-

nated VGAM RNA, also designated SEQ ID:3763.

[38625] Another function of VGAM1052 is therefore inhibition of KIAA0356 (Accession XM_038655). Accordingly, utilities of VGAM1052 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0356. KIAA1464 (Accession XM_043069) is another VGAM1052 host target gene. KIAA1464 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1464, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1464 BINDING SITE, designated SEQ ID:33881, to the nucleotide sequence of VGAM1052 RNA, herein designated VGAM RNA, also designated SEQ ID:3763.

[38626] Another function of VGAM1052 is therefore inhibition of KIAA1464 (Accession XM_043069). Accordingly, utilities of VGAM1052 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1464. PRO0365 (Accession NM_014126) is another VGAM1052 host target gene. PRO0365 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRO0365, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO0365 BINDING SITE, designated SEQ ID:15388, to the nucleotide sequence of VGAM1052 RNA, herein designated VGAM RNA, also designated SEQ ID:3763.

[38627] Another function of VGAM1052 is therefore inhibition of PRO0365 (Accession NM_014126). Accordingly, utilities of VGAM1052 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO0365. SC65 (Accession NM_006455) is another VGAM1052 host target gene. SC65 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SC65, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SC65 BINDING SITE, designated SEQ ID:13174, to the nucleotide sequence of VGAM1052 RNA, herein designated VGAM RNA, also designated SEQ ID:3763.

[38628] Another function of VGAM1052 is therefore inhibition of SC65 (Accession NM_006455). Accordingly, utilities of VGAM1052 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with SC65. Septin 3 (SEPT3, Accession NM_019106) is another VGAM1052 host target gene. SEPT3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SEPT3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEPT3 BINDING SITE, designated SEQ ID:21179, to the nucleotide sequence of VGAM1052 RNA, herein designated VGAM RNA, also designated SEQ ID:3763.

[38629] Another function of VGAM1052 is therefore inhibition of Septin 3 (SEPT3, Accession NM_019106). Accordingly, utilities of VGAM1052 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEPT3. TED (Accession NM_015686) is another VGAM1052 host target gene. TED BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TED, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TED BINDING SITE, designated SEQ ID:17914, to the nucleotide sequence of

VGAM1052 RNA, herein designated VGAM RNA, also designated SEQ ID:3763.

[38630] Another function of VGAM1052 is therefore inhibition of TED (Accession NM_015686). Accordingly, utilities of VGAM1052 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TED. LOC129195 (Accession XM_066378) is another VGAM1052 host target gene. LOC129195 BINDING SITE1 through LOC129195 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LOC129195, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC129195 BINDING SITE1 through LOC129195 BINDING SITE3, designated SEQ ID:37323, SEQ ID:37324 and SEQ ID:37325 respectively, to the nucleotide sequence of VGAM1052 RNA, herein designated VGAM RNA, also designated SEQ ID:3763.

[38631] Another function of VGAM1052 is therefore inhibition of LOC129195 (Accession XM_066378). Accordingly, utilities of VGAM1052 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC129195. LOC149606 (Accession XM_086600) is an-

other VGAM1052 host target gene. LOC149606 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC149606, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149606 BINDING SITE, designated SEQ ID:38782, to the nucleotide sequence of VGAM1052 RNA, herein designated VGAM RNA, also designated SEQ ID:3763.

[38632] Another function of VGAM1052 is therefore inhibition of LOC149606 (Accession XM_086600). Accordingly, utilities of VGAM1052 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149606. LOC150197 (Accession XM_086801) is another VGAM1052 host target gene. LOC150197 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC150197, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150197 BINDING SITE, designated SEQ ID:38866, to the nucleotide sequence of VGAM1052 RNA, herein designated VGAM RNA, also designated SEQ ID:3763.

[38633] Another function of VGAM1052 is therefore inhibition of LOC150197 (Accession XM_086801). Accordingly, utilities of VGAM1052 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150197. LOC158490 (Accession XM_088585) is another VGAM1052 host target gene. LOC158490 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC158490, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158490 BINDING SITE, designated SEQ ID:39848, to the nucleotide sequence of VGAM1052 RNA, herein designated VGAM RNA, also designated SEQ ID:3763.

[38634] Another function of VGAM1052 is therefore inhibition of LOC158490 (Accession XM_088585). Accordingly, utilities of VGAM1052 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158490. LOC220073 (Accession XM_167847) is another VGAM1052 host target gene. LOC220073 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC220073, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220073 BINDING SITE, designated SEQ ID:44874, to the nucleotide sequence of VGAM1052 RNA, herein designated VGAM RNA, also designated SEQ ID:3763.

[38635] Another function of VGAM1052 is therefore inhibition of LOC220073 (Accession XM_167847). Accordingly, utilities of VGAM1052 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220073. LOC90917 (Accession XM_034861) is another VGAM1052 host target gene. LOC90917 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90917, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90917 BINDING SITE, designated SEQ ID:32164, to the nucleotide sequence of VGAM1052 RNA, herein designated VGAM RNA, also designated SEQ ID:3763.

[38636] Another function of VGAM1052 is therefore inhibition of LOC90917 (Accession XM_034861). Accordingly, utilities of VGAM1052 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC90917. LOC91069 (Accession XM_035824) is another VGAM1052 host target gene. LOC91069 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91069, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91069 BINDING SITE, designated SEQ ID:32346, to the nucleotide sequence of VGAM1052 RNA, herein designated VGAM RNA, also designated SEQ ID:3763.

[38637] Another function of VGAM1052 is therefore inhibition of LOC91069 (Accession XM_035824). Accordingly, utilities of VGAM1052 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91069. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1053 (VGAM1053) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[38638] VGAM1053 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM1053 was detected is described hereinabove with reference to Figs. 1–8.

[38639] VGAM1053 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Meleagrid Herpesvirus 1. VGAM1053 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[38640] VGAM1053 gene encodes a VGAM1053 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1053 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1053 precursor RNA is designated SEQ ID:1039, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1039 is located at position 104991 relative to the genome of Meleagrid Herpesvirus 1.

[38641] VGAM1053 precursor RNA folds onto itself, forming VGAM1053 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide

sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[38642] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1053 folded precursor RNA into VGAM1053 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1053 RNA is designated SEQ ID:3764, and is provided hereinbelow with reference to the sequence listing part.

[38643] VGAM1053 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1053 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1053 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[38644] VGAM1053 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM1053 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1053 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1053 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1053 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[38645] The complementary binding of VGAM1053 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM1053 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1053 host target RNA into VGAM1053 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[38646] It is appreciated that VGAM1053 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1053 host target genes. The mRNA of each one of this plurality of VGAM1053 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1053 RNA, herein designated VGAM RNA, and which when bound by VGAM1053 RNA causes inhibition of translation of respective one or more VGAM1053 host target proteins.

[38647] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1053 gene, herein designated VGAM GENE, on one or more VGAM1053 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[38648] It is yet further appreciated that a function of VGAM1053 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1053 include diagnosis, prevention and treatment of viral infection by Meleagrid Herpesvirus 1. Specific functions, and accordingly utilities, of VGAM1053 correlate with, and may be deduced from, the identity of the host target genes which VGAM1053 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[38649] Nucleotide sequences of the VGAM1053 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1053 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM1053 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1053 are further described hereinbelow with reference to Table 1.

[38650] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1053 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1053 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[38651] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1053 gene, herein designated VGAM is inhibition of expression of VGAM1053 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1053 correlate with, and may be deduced from, the identity of the target genes which VGAM1053 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[38652] Oncostatin M Receptor (OSMR, Accession NM_003999) is a VGAM1053 host target gene. OSMR BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by OSMR, corresponding to a HOST

TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OSMR BINDING SITE, designated SEQ ID:10150, to the nucleotide sequence of VGAM1053 RNA, herein designated VGAM RNA, also designated SEQ ID:3764.

[38653] A function of VGAM1053 is therefore inhibition of Oncostatin M Receptor (OSMR, Accession NM_003999). Accordingly, utilities of VGAM1053 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OSMR. LOC127943 (Accession XM_059195) is another VGAM1053 host target gene. LOC127943 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC127943, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC127943 BINDING SITE, designated SEQ ID:36913, to the nucleotide sequence of VGAM1053 RNA, herein designated VGAM RNA, also designated SEQ ID:3764.

[38654] Another function of VGAM1053 is therefore inhibition of LOC127943 (Accession XM_059195). Accordingly, utilities of VGAM1053 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC127943. LOC131873 (Accession XM_067585) is another VGAM1053 host target gene. LOC131873 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC131873, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC131873 BINDING SITE, designated SEQ ID:37365, to the nucleotide sequence of VGAM1053 RNA, herein designated VGAM RNA, also designated SEQ ID:3764.

[38655] Another function of VGAM1053 is therefore inhibition of LOC131873 (Accession XM_067585). Accordingly, utilities of VGAM1053 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC131873. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1054 (VGAM1054) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[38656] VGAM1054 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1054 was detected is described hereinabove with reference to Figs. 1–8.

[38657] VGAM1054 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Melanoplus Sanguinipes Entomopoxvirus. VGAM1054 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[38658] VGAM1054 gene encodes a VGAM1054 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1054 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1054 precursor RNA is designated SEQ ID:1040, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1040 is located at position 193129 relative to the genome of Melanoplus Sanguinipes Entomopoxvirus.

[38659] VGAM1054 precursor RNA folds onto itself, forming VGAM1054 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by

miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[38660] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1054 folded precursor RNA into VGAM1054 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM1054 RNA is designated SEQ ID:3765, and is provided hereinbelow with reference to the sequence listing part.

[38661] VGAM1054 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1054 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1054 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[38662] VGAM1054 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1054 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1054 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1054 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1054 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[38663] The complementary binding of VGAM1054 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM1054 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1054 host target RNA into VGAM1054 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[38664] It is appreciated that VGAM1054 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1054 host target genes. The mRNA of each one of this plurality of VGAM1054 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1054 RNA, herein designated VGAM RNA, and which when bound by VGAM1054 RNA causes inhibition of translation of respective one or more VGAM1054 host target proteins.

[38665] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1054 gene, herein designated VGAM GENE, on one or more VGAM1054 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[38666] It is yet further appreciated that a function of VGAM1054 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1054 include diagnosis, prevention and treatment of viral infection by Melanoplus Sanguinipes Entomopoxvirus. Specific functions, and accordingly utilities, of VGAM1054 correlate with, and may be deduced from, the identity of the host target genes which VGAM1054 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[38667] Nucleotide sequences of the VGAM1054 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM1054 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1054 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1054 are further described hereinbelow with reference to Table 1.

[38668] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1054 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1054 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[38669] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1054 gene, herein designated VGAM is inhibition of expression of VGAM1054 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1054 correlate with, and may be deduced from, the identity of the target genes which VGAM1054 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[38670] Ras Homolog Gene Family, Member E (ARHE, Accession NM_005168) is a VGAM1054 host target gene. ARHE BINDING SITE is HOST TARGET binding site found in the

3` untranslated region of mRNA encoded by ARHE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARHE BINDING SITE, designated SEQ ID:11670, to the nucleotide sequence of VGAM1054 RNA, herein designated VGAM RNA, also designated SEQ ID:3765.

[38671] A function of VGAM1054 is therefore inhibition of Ras Homolog Gene Family, Member E (ARHE, Accession NM_005168). Accordingly, utilities of VGAM1054 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHE. FLJ11116 (Accession XM_093216) is another VGAM1054 host target gene. FLJ11116 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ11116, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11116 BINDING SITE, designated SEQ ID:40185, to the nucleotide sequence of VGAM1054 RNA, herein designated VGAM RNA, also designated SEQ ID:3765.

[38672] Another function of VGAM1054 is therefore inhibition of

FLJ11116 (Accession XM_093216). Accordingly, utilities of VGAM1054 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11116. KIAA1136 (Accession XM_166110) is another VGAM1054 host target gene. KIAA1136 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1136, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1136 BINDING SITE, designated SEQ ID:43886, to the nucleotide sequence of VGAM1054 RNA, herein designated VGAM RNA, also designated SEQ ID:3765.

[38673] Another function of VGAM1054 is therefore inhibition of KIAA1136 (Accession XM_166110). Accordingly, utilities of VGAM1054 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1136. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1055 (VGAM1055) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes

is known in the art.

[38674] VGAM1055 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1055 was detected is described hereinabove with reference to Figs. 1–8.

[38675] VGAM1055 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mayaro Virus. VGAM1055 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[38676] VGAM1055 gene encodes a VGAM1055 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1055 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1055 precursor RNA is designated SEQ ID:1041, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1041 is located at position 10628 relative to the genome of Mayaro Virus.

[38677] VGAM1055 precursor RNA folds onto itself, forming VGAM1055 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two–

dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[38678] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1055 folded precursor RNA into VGAM1055 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of VGAM1055 RNA is designated SEQ ID:3766, and is provided hereinbelow with reference to the sequence listing part.

[38679] VGAM1055 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1055 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1055 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein cod-

ing region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[38680] VGAM1055 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1055 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1055 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1055 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1055 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR

and 5`UTR regions.

[38681] The complementary binding of VGAM1055 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1055 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1055 host target RNA into VGAM1055 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[38682] It is appreciated that VGAM1055 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1055 host target genes. The mRNA of each one of this plurality of VGAM1055 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1055 RNA, herein designated VGAM RNA, and which when bound by VGAM1055 RNA causes inhibition of translation of respective one or more VGAM1055 host target proteins.

[38683] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1055 gene, herein designated VGAM GENE, on one

or more VGAM1055 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[38684] It is yet further appreciated that a function of VGAM1055 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1055 include diagnosis, prevention and treatment of viral infection by Mayaro Virus. Specific functions, and accordingly utilities, of VGAM1055 correlate with, and may be deduced from, the identity of the host target genes which VGAM1055 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[38685] Nucleotide sequences of the VGAM1055 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1055 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1055 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1055 are further described hereinbelow with reference to Table 1.

[38686] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1055 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1055 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[38687] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1055 gene, herein designated VGAM is inhibition of expression of VGAM1055 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1055 correlate with, and may be deduced from, the identity of the target genes which VGAM1055 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[38688] ATPase, Class VI, Type 11B (ATP11B, Accession

XM_087254) is a VGAM1055 host target gene. ATP11B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ATP11B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP11B BINDING SITE, designated SEQ ID:39143, to the nucleotide sequence of VGAM1055 RNA, herein designated VGAM RNA, also designated SEQ ID:3766.

[38689] A function of VGAM1055 is therefore inhibition of ATPase, Class VI, Type 11B (ATP11B, Accession XM_087254), a gene which is phosphorylated in their intermediate state, drives uphill transport of ions across membranes. Accordingly, utilities of VGAM1055 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP11B. The function of ATP11B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM665.KIAA0442 (Accession NM_015570) is another VGAM1055 host target gene. KIAA0442 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0442, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0442 BINDING SITE, designated SEQ ID:17843, to the nucleotide sequence of VGAM1055 RNA, herein designated VGAM RNA, also designated SEQ ID:3766.

[38690] Another function of VGAM1055 is therefore inhibition of KIAA0442 (Accession NM_015570). Accordingly, utilities of VGAM1055 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0442. MIPOL1 (Accession XM_085077) is another VGAM1055 host target gene. MIPOL1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MIPOL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MIPOL1 BINDING SITE, designated SEQ ID:37814, to the nucleotide sequence of VGAM1055 RNA, herein designated VGAM RNA, also designated SEQ ID:3766.

[38691] Another function of VGAM1055 is therefore inhibition of MIPOL1 (Accession XM_085077). Accordingly, utilities of VGAM1055 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with MIPOL1. LOC256789 (Accession XM_173369) is another VGAM1055 host target gene. LOC256789 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC256789, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256789 BINDING SITE, designated SEQ ID:46539, to the nucleotide sequence of VGAM1055 RNA, herein designated VGAM RNA, also designated SEQ ID:3766.

[38692] Another function of VGAM1055 is therefore inhibition of LOC256789 (Accession XM_173369). Accordingly, utilities of VGAM1055 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256789. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1056 (VGAM1056) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[38693] VGAM1056 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1056 was detected is described hereinabove with reference to Figs. 1–8.

[38694] VGAM1056 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mayaro Virus.

VGAM1056 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[38695] VGAM1056 gene encodes a VGAM1056 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1056 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1056 precursor RNA is designated SEQ ID:1042, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1042 is located at position 10251 relative to the genome of Mayaro Virus.

[38696] VGAM1056 precursor RNA folds onto itself, forming VGAM1056 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by

miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[38697] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1056 folded precursor RNA into VGAM1056 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1056 RNA is designated SEQ ID:3767, and is provided hereinbelow with reference to the sequence listing part.

[38698] VGAM1056 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1056 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1056 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[38699] VGAM1056 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1056 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1056 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1056 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1056 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[38700] The complementary binding of VGAM1056 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM1056 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1056 host target RNA into VGAM1056 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[38701] It is appreciated that VGAM1056 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1056 host target genes. The mRNA of each one of this plurality of VGAM1056 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1056 RNA, herein designated VGAM RNA, and which when bound by VGAM1056 RNA causes inhibition of translation of respective one or more VGAM1056 host target proteins.

[38702] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1056 gene, herein designated VGAM GENE, on one or more VGAM1056 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[38703] It is yet further appreciated that a function of VGAM1056 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1056 include diagnosis, prevention and treatment of viral infection by Mayaro Virus. Specific functions, and accordingly utilities, of VGAM1056 correlate with, and may be deduced from, the identity of the host target genes which VGAM1056 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[38704] Nucleotide sequences of the VGAM1056 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM1056 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1056 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1056 are further described hereinbelow with reference to Table 1.

[38705] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1056 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1056 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[38706] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1056 gene, herein designated VGAM is inhibition of expression of VGAM1056 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1056 correlate with, and may be deduced from, the identity of the target genes which VGAM1056 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[38707] LOC148887 (Accession XM_097537) is a VGAM1056 host target gene. LOC148887 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA

encoded by LOC148887, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148887 BINDING SITE, designated SEQ ID:40911, to the nucleotide sequence of VGAM1056 RNA, herein designated VGAM RNA, also designated SEQ ID:3767.

[38708] A function of VGAM1056 is therefore inhibition of LOC148887 (Accession XM_097537). Accordingly, utilities of VGAM1056 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148887. LOC90632 (Accession XM_033067) is another VGAM1056 host target gene. LOC90632 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC90632, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90632 BINDING SITE, designated SEQ ID:31830, to the nucleotide sequence of VGAM1056 RNA, herein designated VGAM RNA, also designated SEQ ID:3767.

[38709] Another function of VGAM1056 is therefore inhibition of LOC90632 (Accession XM_033067). Accordingly, utilities

of VGAM1056 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90632. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1057 (VGAM1057) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[38710] VGAM1057 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1057 was detected is described hereinabove with reference to Figs. 1-8.

[38711] VGAM1057 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Murid Herpesvirus 4. VGAM1057 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[38712] VGAM1057 gene encodes a VGAM1057 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1057 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nu-

cleotide sequence of VGAM1057 precursor RNA is designated SEQ ID:1043, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1043 is located at position 101664 relative to the genome of Murid Herpesvirus 4.

- [38713] VGAM1057 precursor RNA folds onto itself, forming VGAM1057 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [38714] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1057 folded precursor RNA into VGAM1057 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of VGAM1057 RNA is designated SEQ ID:3768, and

is provided hereinbelow with reference to the sequence listing part.

[38715] VGAM1057 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1057 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1057 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[38716] VGAM1057 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1057 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1057 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing – VGAM1057 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1057 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[38717] The complementary binding of VGAM1057 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1057 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1057 host target RNA into VGAM1057 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[38718] It is appreciated that VGAM1057 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1057 host target genes. The mRNA of each one of this plurality of VGAM1057 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com–

plementary to VGAM1057 RNA, herein designated VGAM RNA, and which when bound by VGAM1057 RNA causes inhibition of translation of respective one or more VGAM1057 host target proteins.

[38719] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1057 gene, herein designated VGAM GENE, on one or more VGAM1057 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[38720] It is yet further appreciated that a function of VGAM1057 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1057 include diagnosis, prevention and treatment of viral infection by Murid Herpesvirus 4. Specific functions, and accordingly utilities, of VGAM1057 correlate with, and may be deduced from, the identity of the host target genes which VGAM1057 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[38721] Nucleotide sequences of the VGAM1057 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1057 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1057 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1057 are further described hereinbelow with reference to Table 1.

[38722] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1057 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1057 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[38723] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM1057 gene, herein designated VGAM is inhibition of expression of VGAM1057 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1057 correlate with, and may be deduced from, the identity of the target genes which VGAM1057 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[38724] Integrin, Beta 1 (fibronectin receptor, beta polypeptide, antigen CD29 includes MDF2, MSK12) (ITGB1, Accession NM_033666) is a VGAM1057 host target gene. ITGB1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ITGB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITGB1 BINDING SITE, designated SEQ ID:27394, to the nucleotide sequence of VGAM1057 RNA, herein designated VGAM RNA, also designated SEQ ID:3768.

[38725] A function of VGAM1057 is therefore inhibition of Integrin, Beta 1 (fibronectin receptor, beta polypeptide, antigen CD29 includes MDF2, MSK12) (ITGB1, Accession NM_033666), a gene which acts as a fibronectin receptor. Accordingly, utilities of VGAM1057 include diagnosis,

prevention and treatment of diseases and clinical conditions associated with ITGB1. The function of ITGB1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM427.KIAA0258 (Accession NM_014785) is another VGAM1057 host target gene. KIAA0258 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0258, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0258 BINDING SITE, designated SEQ ID:16650, to the nucleotide sequence of VGAM1057 RNA, herein designated VGAM RNA, also designated SEQ ID:3768.

[38726] Another function of VGAM1057 is therefore inhibition of KIAA0258 (Accession NM_014785). Accordingly, utilities of VGAM1057 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0258. KIAA1819 (Accession XM_045716) is another VGAM1057 host target gene. KIAA1819 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1819, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1819 BINDING SITE, designated SEQ ID:34535, to the nucleotide sequence of VGAM1057 RNA, herein designated VGAM RNA, also designated SEQ ID:3768.

[38727] Another function of VGAM1057 is therefore inhibition of KIAA1819 (Accession XM_045716). Accordingly, utilities of VGAM1057 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1819. LOC255862 (Accession XM_170505) is another VGAM1057 host target gene. LOC255862 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC255862, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255862 BINDING SITE, designated SEQ ID:45340, to the nucleotide sequence of VGAM1057 RNA, herein designated VGAM RNA, also designated SEQ ID:3768.

[38728] Another function of VGAM1057 is therefore inhibition of LOC255862 (Accession XM_170505). Accordingly, utilities of VGAM1057 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC255862. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1058 (VGAM1058) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[38729] VGAM1058 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1058 was detected is described hereinabove with reference to Figs. 1–8.

[38730] VGAM1058 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Murid Herpesvirus 4. VGAM1058 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[38731] VGAM1058 gene encodes a VGAM1058 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1058 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1058 precursor RNA is desig-

nated SEQ ID:1044, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1044 is located at position 98739 relative to the genome of Murid Herpesvirus 4.

- [38732] VGAM1058 precursor RNA folds onto itself, forming VGAM1058 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [38733] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1058 folded precursor RNA into VGAM1058 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1058 RNA is designated SEQ ID:3769, and is provided hereinbelow with reference to the sequence

listing part.

[38734] VGAM1058 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1058 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1058 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[38735] VGAM1058 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1058 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1058 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1058 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM1058 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[38736] The complementary binding of VGAM1058 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1058 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1058 host target RNA into VGAM1058 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[38737] It is appreciated that VGAM1058 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1058 host target genes. The mRNA of each one of this plurality of VGAM1058 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1058 RNA, herein designated VGAM

RNA, and which when bound by VGAM1058 RNA causes inhibition of translation of respective one or more VGAM1058 host target proteins.

[38738] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1058 gene, herein designated VGAM GENE, on one or more VGAM1058 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[38739] It is yet further appreciated that a function of VGAM1058 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1058 include diagnosis, prevention and treatment of viral infection by Murid Herpesvirus 4. Specific functions, and accordingly utilities, of VGAM1058

correlate with, and may be deduced from, the identity of the host target genes which VGAM1058 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[38740] Nucleotide sequences of the VGAM1058 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1058 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1058 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1058 are further described hereinbelow with reference to Table 1.

[38741] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1058 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1058 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[38742] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1058 gene, herein designated VGAM is inhibition of expression of VGAM1058 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1058 correlate with, and may be deduced

from, the identity of the target genes which VGAM1058 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[38743] Absent In Melanoma 1 (AIM1, Accession XM_166300) is a VGAM1058 host target gene. AIM1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AIM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AIM1 BINDING SITE, designated SEQ ID:44116, to the nucleotide sequence of VGAM1058 RNA, herein designated VGAM RNA, also designated SEQ ID:3769.

[38744] A function of VGAM1058 is therefore inhibition of Absent In Melanoma 1 (AIM1, Accession XM_166300), a gene which interactions with the cytoskeleton. Accordingly, utilities of VGAM1058 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AIM1. The function of AIM1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM808. Aspartate Beta-hydroxylase (ASPH, Accession NM_032466) is another VGAM1058 host target

gene. ASPH BINDING SITE1 and ASPH BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ASPH, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ASPH BINDING SITE1 and ASPH BINDING SITE2, designated SEQ ID:26221 and SEQ ID:26226 respectively, to the nucleotide sequence of VGAM1058 RNA, herein designated VGAM RNA, also designated SEQ ID:3769.

[38745] Another function of VGAM1058 is therefore inhibition of Aspartate Beta-hydroxylase (ASPH, Accession NM_032466), a gene which specifically hydroxylates the beta carbon of aspartic acid or asparagine residues in certain epidermal growth factor (EGF)-like domains of a number of proteins. Accordingly, utilities of VGAM1058 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ASPH. The function of ASPH and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM47.Methionine Adenosyltransferase I, Alpha (MAT1A, Accession XM_165540) is another VGAM1058

host target gene. MAT1A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MAT1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAT1A BINDING SITE, designated SEQ ID:43669, to the nucleotide sequence of VGAM1058 RNA, herein designated VGAM RNA, also designated SEQ ID:3769.

[38746] Another function of VGAM1058 is therefore inhibition of Methionine Adenosyltransferase I, Alpha (MAT1A, Accession XM_165540). Accordingly, utilities of VGAM1058 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAT1A. Neuroblastoma RAS Viral (v-ras) Oncogene Homolog (NRAS, Accession NM_002524) is another VGAM1058 host target gene. NRAS BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NRAS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NRAS BINDING SITE, designated SEQ ID:8363, to the nucleotide sequence of VGAM1058 RNA, herein

designated VGAM RNA, also designated SEQ ID:3769.

[38747] Another function of VGAM1058 is therefore inhibition of Neuroblastoma RAS Viral (v-ras) Oncogene Homolog (NRAS, Accession NM_002524), a gene which ras proteins bind gdp/gtp and possess intrinsic gtpase activity. Accordingly, utilities of VGAM1058 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NRAS. The function of NRAS and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM351.3-oxoacid CoA Transferase (OXCT, Accession NM_000436) is another VGAM1058 host target gene. OXCT BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by OXCT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OXCT BINDING SITE, designated SEQ ID:6019, to the nucleotide sequence of VGAM1058 RNA, herein designated VGAM RNA, also designated SEQ ID:3769.

[38748] Another function of VGAM1058 is therefore inhibition of 3-oxoacid CoA Transferase (OXCT, Accession

NM_000436). Accordingly, utilities of VGAM1058 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OXCT. Calcium-binding tyrosine-(Y)-phosphorylation Regulated (fibrousheathin 2) (CABYR, Accession NM_012189) is another VGAM1058 host target gene. CABYR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CABYR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CABYR BINDING SITE, designated SEQ ID:14478, to the nucleotide sequence of VGAM1058 RNA, herein designated VGAM RNA, also designated SEQ ID:3769.

[38749] Another function of VGAM1058 is therefore inhibition of Calcium-binding tyrosine-(Y)-phosphorylation Regulated (fibrousheathin 2) (CABYR, Accession NM_012189). Accordingly, utilities of VGAM1058 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CABYR. DKFZp434K1210 (Accession NM_017606) is another VGAM1058 host target gene. DKFZp434K1210 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

DKFZp434K1210, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp434K1210 BINDING SITE, designated SEQ ID:19101, to the nucleotide sequence of VGAM1058 RNA, herein designated VGAM RNA, also designated SEQ ID:3769.

[38750] Another function of VGAM1058 is therefore inhibition of DKFZp434K1210 (Accession NM_017606). Accordingly, utilities of VGAM1058 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434K1210. DKFZP566D1346 (Accession NM_030816) is another VGAM1058 host target gene. DKFZP566D1346 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP566D1346, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP566D1346 BINDING SITE, designated SEQ ID:25137, to the nucleotide sequence of VGAM1058 RNA, herein designated VGAM RNA, also designated SEQ ID:3769.

[38751] Another function of VGAM1058 is therefore inhibition of

DKFZP566D1346 (Accession NM_030816). Accordingly, utilities of VGAM1058 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP566D1346. DKFZp586H0623 (Accession NM_017540) is another VGAM1058 host target gene. DKFZp586H0623 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp586H0623, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp586H0623 BINDING SITE, designated SEQ ID:18982, to the nucleotide sequence of VGAM1058 RNA, herein designated VGAM RNA, also designated SEQ ID:3769.

[38752] Another function of VGAM1058 is therefore inhibition of DKFZp586H0623 (Accession NM_017540). Accordingly, utilities of VGAM1058 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp586H0623. FLJ11383 (Accession NM_024938) is another VGAM1058 host target gene. FLJ11383 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ11383, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11383 BINDING SITE, designated SEQ ID:24478, to the nucleotide sequence of VGAM1058 RNA, herein designated VGAM RNA, also designated SEQ ID:3769.

[38753] Another function of VGAM1058 is therefore inhibition of FLJ11383 (Accession NM_024938). Accordingly, utilities of VGAM1058 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11383. FLJ20694 (Accession NM_017928) is another VGAM1058 host target gene. FLJ20694 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20694, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20694 BINDING SITE, designated SEQ ID:19609, to the nucleotide sequence of VGAM1058 RNA, herein designated VGAM RNA, also designated SEQ ID:3769.

[38754] Another function of VGAM1058 is therefore inhibition of FLJ20694 (Accession NM_017928). Accordingly, utilities of VGAM1058 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

FLJ20694. KIAA1691 (Accession XM_166523) is another VGAM1058 host target gene. KIAA1691 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1691, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1691 BINDING SITE, designated SEQ ID:44469, to the nucleotide sequence of VGAM1058 RNA, herein designated VGAM RNA, also designated SEQ ID:3769.

[38755] Another function of VGAM1058 is therefore inhibition of KIAA1691 (Accession XM_166523). Accordingly, utilities of VGAM1058 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1691. MGC35558 (Accession NM_145013) is another VGAM1058 host target gene. MGC35558 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC35558, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC35558 BINDING SITE, designated SEQ ID:29617, to the nucleotide sequence of VGAM1058 RNA, herein design-

nated VGAM RNA, also designated SEQ ID:3769.

[38756] Another function of VGAM1058 is therefore inhibition of MGC35558 (Accession NM_145013). Accordingly, utilities of VGAM1058 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC35558. PRO1843 (Accession NM_018507) is another VGAM1058 host target gene. PRO1843 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PRO1843, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO1843 BINDING SITE, designated SEQ ID:20573, to the nucleotide sequence of VGAM1058 RNA, herein designated VGAM RNA, also designated SEQ ID:3769.

[38757] Another function of VGAM1058 is therefore inhibition of PRO1843 (Accession NM_018507). Accordingly, utilities of VGAM1058 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO1843. SH3 Domain Binding Glutamic Acid-rich Protein Like (SH3BGRL, Accession XM_030373) is another VGAM1058 host target gene. SH3BGRL BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by SH3BGRL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SH3BGRL BINDING SITE, designated SEQ ID:31025, to the nucleotide sequence of VGAM1058 RNA, herein designated VGAM RNA, also designated SEQ ID:3769.

[38758] Another function of VGAM1058 is therefore inhibition of SH3 Domain Binding Glutamic Acid-rich Protein Like (SH3BGRL, Accession XM_030373). Accordingly, utilities of VGAM1058 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SH3BGRL. Zinc Finger Protein 387 (ZNF387, Accession NM_014682) is another VGAM1058 host target gene. ZNF387 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF387, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF387 BINDING SITE, designated SEQ ID:16177, to the nucleotide sequence of VGAM1058 RNA, herein designated VGAM RNA, also designated SEQ ID:3769.

[38759] Another function of VGAM1058 is therefore inhibition of Zinc Finger Protein 387 (ZNF387, Accession NM_014682). Accordingly, utilities of VGAM1058 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF387. LOC152627 (Accession XM_087495) is another VGAM1058 host target gene. LOC152627 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC152627, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152627 BINDING SITE, designated SEQ ID:39294, to the nucleotide sequence of VGAM1058 RNA, herein designated VGAM RNA, also designated SEQ ID:3769.

[38760] Another function of VGAM1058 is therefore inhibition of LOC162333 (Accession XM_102591). Accordingly, utilities of VGAM1058 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC162333. LOC162333 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC162333, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC162333 BINDING SITE, designated SEQ ID:42131, to the nucleotide sequence of VGAM1058 RNA, herein designated VGAM RNA, also designated SEQ ID:3769.

[38761] Another function of VGAM1058 is therefore inhibition of LOC162333 (Accession XM_102591). Accordingly, utilities of VGAM1058 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC162333. LOC168082 (Accession XM_094852) is another VGAM1058 host target gene. LOC168082 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC168082, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC168082 BINDING SITE, designated SEQ ID:40238, to the nucleotide sequence of VGAM1058 RNA, herein designated VGAM RNA, also designated SEQ ID:3769.

[38762] Another function of VGAM1058 is therefore inhibition of LOC168082 (Accession XM_094852). Accordingly, utilities of VGAM1058 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC168082. LOC90906 (Accession XM_034809) is another VGAM1058 host target gene. LOC90906 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC90906, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90906 BINDING SITE, designated SEQ ID:32153, to the nucleotide sequence of VGAM1058 RNA, herein designated VGAM RNA, also designated SEQ ID:3769.

[38763] Another function of VGAM1058 is therefore inhibition of LOC90906 (Accession XM_034809). Accordingly, utilities of VGAM1058 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90906. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1059 (VGAM1059) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[38764] VGAM1059 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1059 was detected is described hereinabove with reference to Figs. 1–8.

[38765] VGAM1059 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Murid Herpesvirus 4. VGAM1059 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[38766] VGAM1059 gene encodes a VGAM1059 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1059 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1059 precursor RNA is designated SEQ ID:1045, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1045 is located at position 97788 relative to the genome of Murid Herpesvirus 4.

[38767] VGAM1059 precursor RNA folds onto itself, forming VGAM1059 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by

miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[38768] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1059 folded precursor RNA into VGAM1059 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1059 RNA is designated SEQ ID:3770, and is provided hereinbelow with reference to the sequence listing part.

[38769] VGAM1059 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1059 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1059 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[38770] VGAM1059 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1059 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1059 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1059 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1059 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[38771] The complementary binding of VGAM1059 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM1059 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1059 host target RNA into VGAM1059 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[38772] It is appreciated that VGAM1059 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1059 host target genes. The mRNA of each one of this plurality of VGAM1059 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1059 RNA, herein designated VGAM RNA, and which when bound by VGAM1059 RNA causes inhibition of translation of respective one or more VGAM1059 host target proteins.

[38773] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1059 gene, herein designated VGAM GENE, on one or more VGAM1059 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[38774] It is yet further appreciated that a function of VGAM1059 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1059 include diagnosis, prevention and treatment of viral infection by Murid Herpesvirus 4. Specific functions, and accordingly utilities, of VGAM1059 correlate with, and may be deduced from, the identity of the host target genes which VGAM1059 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[38775] Nucleotide sequences of the VGAM1059 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM1059 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1059 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1059 are further described hereinbelow with reference to Table 1.

[38776] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1059 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1059 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[38777] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1059 gene, herein designated VGAM is inhibition of expression of VGAM1059 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1059 correlate with, and may be deduced from, the identity of the target genes which VGAM1059 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[38778] A Disintegrin-like and Metalloprotease (reprolysin type) with Thrombospondin Type 1 Motif, 4 (ADAMTS4, Accession NM_005099) is a VGAM1059 host target gene.

ADAMTS4 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ADAMTS4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADAMTS4 BINDING SITE, designated SEQ ID:11568, to the nucleotide sequence of VGAM1059 RNA, herein designated VGAM RNA, also designated SEQ ID:3770.

[38779] A function of VGAM1059 is therefore inhibition of A Disintegrin-like and Metalloprotease (reprolysin type) with Thrombospondin Type 1 Motif, 4 (ADAMTS4, Accession NM_005099), a gene which cleaves aggrecan, a cartilage proteoglycan, and may be involved in its turnover. Accordingly, utilities of VGAM1059 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADAMTS4. The function of ADAMTS4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM809. Angiopoietin 1 (ANGPT1, Accession NM_001146) is another VGAM1059 host target gene. ANGPT1 BINDING SITE is HOST TARGET binding site found

in the 3` untranslated region of mRNA encoded by ANGPT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ANGPT1 BINDING SITE, designated SEQ ID:6816, to the nucleotide sequence of VGAM1059 RNA, herein designated VGAM RNA, also designated SEQ ID:3770.

[38780] Another function of VGAM1059 is therefore inhibition of Angiopoietin 1 (ANGPT1, Accession NM_001146), a gene which binds and activates tie2 receptor by inducing its tyrosine phosphorylation. Accordingly, utilities of VGAM1059 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ANGPT1. The function of ANGPT1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM291. Cystic Fibrosis Transmembrane Conductance Regulator, ATP-binding Cassette (sub-family C, member 7) (CFTR, Accession NM_000492) is another VGAM1059 host target gene. CFTR BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CFTR, corresponding to a HOST

TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CFTR BINDING SITE, designated SEQ ID:6101, to the nucleotide sequence of VGAM1059 RNA, herein designated VGAM RNA, also designated SEQ ID:3770.

[38781] Another function of VGAM1059 is therefore inhibition of Cystic Fibrosis Transmembrane Conductance Regulator, ATP-binding Cassette (sub-family C, member 7) (CFTR, Accession NM_000492). Accordingly, utilities of VGAM1059 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CFTR. Glutamate Decarboxylase 1 (brain, 67kDa) (GAD1, Accession NM_000817) is another VGAM1059 host target gene. GAD1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GAD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GAD1 BINDING SITE, designated SEQ ID:6481, to the nucleotide sequence of VGAM1059 RNA, herein designated VGAM RNA, also designated SEQ ID:3770.

[38782] Another function of VGAM1059 is therefore inhibition of

Glutamate Decarboxylase 1 (brain, 67kDa) (GAD1, Accession NM_000817), a gene which catalyzes the conversion of glutamic acid to gamma-aminobutyric acid. Accordingly, utilities of VGAM1059 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GAD1. The function of GAD1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM691. Potassium Channel, Subfamily K, Member 3 (KCNK3, Accession NM_002246) is another VGAM1059 host target gene. KCNK3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KCNK3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNK3 BINDING SITE, designated SEQ ID:8034, to the nucleotide sequence of VGAM1059 RNA, herein designated VGAM RNA, also designated SEQ ID:3770.

[38783] Another function of VGAM1059 is therefore inhibition of Potassium Channel, Subfamily K, Member 3 (KCNK3, Accession NM_002246), a gene which is a pH-dependent, voltage-insensitive, background potassium channel. Ac-

cordingly, utilities of VGAM1059 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNK3. The function of KCNK3 has been established by previous studies. Potassium channels are ubiquitous multisubunit membrane proteins that regulate membrane potential in numerous cell types. One family of mammalian K⁺ channels is characterized by the presence of 4 transmembrane domains and 2 P domains per subunit; this family includes TASK, TWIK (KCNK1; 601745), and TREK (KCNK2; 603219). Duprat et al. (1997) identified mouse expressed sequence tags with similarity to TREK and TWIK and cloned a corresponding cDNA from a mouse brain library. The mouse cDNA was used to clone the human counterpart from a kidney cDNA library. The human cDNA, designated TASK, encodes a 394-amino acid polypeptide with 85% identity to the mouse ortholog. The sequence contains consensus sites for N-linked glycosylation and for phosphorylation at the C-terminal. Northern blot analysis showed that TASK is expressed in a variety of human tissues, with highest levels in pancreas and placenta. Expression of the TASK cDNA revealed that the functional protein creates currents that are K(+)–selective, instantaneous, and noninactivating. These currents

showed an outward rectification when external K⁺ was low, but evinced absence of activation and inactivation kinetics as well as voltage independence, characteristics of so-called leak or background conductances. TASK currents were very sensitive to small changes in extracellular pH, suggesting that TASK has a role in cellular responses to changes in extracellular pH. Lesage and Lazdunski (1998) used a radiation hybrid mapping panel to map the human KCNK3 gene to chromosome 2p23 between markers WI13615 and WI11298. By fluorescence in situ hybridization, Manjunath et al. (1999) mapped the KCNK3 gene to 2p24.1–p23.3 and the mouse homolog to chromosome 5B.

[38784] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[38785] Lesage, F.; Lazdunski, M. : Mapping of human potassium channel genes TREK-1 (KCNK2) and TASK (KCNK3) to chromosomes 1q41 and 2p23. *Genomics* 51: 478–479, 1998. ; and

[38786] Manjunath, N. A.; Bray-Ward, P.; Goldstein, S. A. N.; Gallagher, P. G. : Assignment of the 2P domain, acid-sensitive potassium channel OAT1 gene KCNK3 to human

chromosome bands 2p24.1–p.

[38787] Further studies establishing the function and utilities of KCNK3 are found in John Hopkins OMIM database record ID 603220, and in cited publications numbered 243 and 2437 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Antigen P97 (melanoma associated) Identified By Monoclonal Antibodies 133.2 and 96.5 (MFI2, Accession NM_033316) is another VGAM1059 host target gene. MFI2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MFI2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MFI2 BINDING SITE, designated SEQ ID:27153, to the nucleotide sequence of VGAM1059 RNA, herein designated VGAM RNA, also designated SEQ ID:3770.

[38788] Another function of VGAM1059 is therefore inhibition of Antigen P97 (melanoma associated) Identified By Monoclonal Antibodies 133.2 and 96.5 (MFI2, Accession NM_033316). Accordingly, utilities of VGAM1059 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MFI2. Nuclear Receptor

Coactivator 3 (NCOA3, Accession NM_006534) is another VGAM1059 host target gene. NCOA3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NCOA3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NCOA3 BINDING SITE, designated SEQ ID:13287, to the nucleotide sequence of VGAM1059 RNA, herein designated VGAM RNA, also designated SEQ ID:3770.

[38789] Another function of VGAM1059 is therefore inhibition of Nuclear Receptor Coactivator 3 (NCOA3, Accession NM_006534), a gene which directly binds nuclear receptors and stimulates the transcriptional activities in hormone-dependent fashion. Accordingly, utilities of VGAM1059 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NCOA3. The function of NCOA3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM215. Nuclear Receptor Subfamily 2, Group E, Member 1 (NR2E1, Accession NM_003269) is another VGAM1059 host target gene. NR2E1 BINDING SITE is HOST

TARGET binding site found in the 3' untranslated region of mRNA encoded by NR2E1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NR2E1 BINDING SITE, designated SEQ ID:9279, to the nucleotide sequence of VGAM1059 RNA, herein designated VGAM RNA, also designated SEQ ID:3770.

[38790] Another function of VGAM1059 is therefore inhibition of Nuclear Receptor Subfamily 2, Group E, Member 1 (NR2E1, Accession NM_003269), a gene which may be required for brain development and be involved in the regulation of retinal development . Accordingly, utilities of VGAM1059 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NR2E1. The function of NR2E1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM689.Radixin (RDX, Accession NM_002906) is another VGAM1059 host target gene. RDX BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RDX, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RDX BINDING SITE, designated SEQ ID:8810, to the nucleotide sequence of VGAM1059 RNA, herein designated VGAM RNA, also designated SEQ ID:3770.

[38791] Another function of VGAM1059 is therefore inhibition of Radixin (RDX, Accession NM_002906), a gene which plays a crucial role in the binding of the barbed end of actin filaments to the plasma membrane. Accordingly, utilities of VGAM1059 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RDX. The function of RDX and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM290. Surfeit 4 (SURF4, Accession NM_033161) is another VGAM1059 host target gene. SURF4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SURF4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SURF4 BINDING SITE, designated SEQ ID:27014, to the nucleotide sequence of VGAM1059 RNA, herein designated VGAM RNA,

also designated SEQ ID:3770.

[38792] Another function of VGAM1059 is therefore inhibition of Surfeit 4 (SURF4, Accession NM_033161), a gene which is a conserved integral membrane protein containing multiple putative transmembrane regions. Accordingly, utilities of VGAM1059 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SURF4. The function of SURF4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM496. Ubiquitin-conjugating Enzyme E2L 6 (UBE2L6, Accession NM_004223) is another VGAM1059 host target gene. UBE2L6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by UBE2L6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UBE2L6 BINDING SITE, designated SEQ ID:10420, to the nucleotide sequence of VGAM1059 RNA, herein designated VGAM RNA, also designated SEQ ID:3770.

[38793] Another function of VGAM1059 is therefore inhibition of Ubiquitin-conjugating Enzyme E2L 6 (UBE2L6, Accession

NM_004223), a gene which catalyzes the covalent attachment of ubiquitin to other proteins. Accordingly, utilities of VGAM1059 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBE2L6. The function of UBE2L6 has been established by previous studies. Ubiquitination of a protein substrate requires the concerted action of 3 classes of enzymes: E1 ubiquitin-activating enzymes, E2 ubiquitin-conjugating enzymes, and E3 ubiquitin protein ligases. See 600012. E2 enzymes may transfer ubiquitin either directly to a substrate or to an E3 protein. Class I E2s are unable to transfer ubiquitin to proteins in vitro, suggesting that this class of E2s may require an E3 enzyme for substrate recognition. Using a yeast 2-hybrid assay with the E3 enzyme E6AP (OMIM Ref. No. 601623) as bait, Kumar et al. (1997) identified cDNAs encoding a novel class I E2 that they named UBCH8. The predicted 152-amino acid UBCH8 protein is 46% identical to UBCH7 (OMIM Ref. No. 603721). In vitro, recombinant Ubch8 formed thiol ester complexes with ubiquitin and was able to transfer ubiquitin to E6AP. Both UBCH7 and UBCH8 specifically associated with E6AP in yeast 2-hybrid assays, while UBCH5 (OMIM Ref. No. 602961) and UBCH6 (OMIM Ref. No.

602916) interacted selectively with an *S. cerevisiae* E3, RSP5 (see OMIM Ref. No. 602278). In vitro, the E6AP-interacting E2s were also able to function with E6AP in the ubiquitination of a substrate, whereas noninteracting E2s were unable to do so. The authors suggested that selective physical interaction between E2 and E3 enzymes forms the basis of specificity for functionally distinct E2-E3 combinations. By fluorescence in situ hybridization, Ardley et al. (2000) mapped the UBE2L6 gene to chromosome 11q12.

[38794] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[38795] Ardley, H. C.; Rose, S. A.; Tan, N.; Leek, J. P.; Markham, A. F.; Robinson, P. A. : Genomic organization of the human ubiquitin-conjugating enzyme gene, UBE2L6 on chromosome 11q12. *Cytogenet. Cell Genet.* 89: 137-140, 2000. ; and

[38796] Kumar, S.; Kao, W. H.; Howley, P. M. : Physical interaction between specific E2 and Hect E3 enzymes determines functional cooperativity. *J. Biol. Chem.* 272: 13548-13554, 1997.

[38797] Further studies establishing the function and utilities of

UBE2L6 are found in John Hopkins OMIM database record ID 603890, and in cited publications numbered 7630–7631 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Vacuolar Protein Sorting 41 (yeast) (VPS41, Accession NM_014396) is another VGAM1059 host target gene. VPS41 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by VPS41, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VPS41 BINDING SITE, designated SEQ ID:15738, to the nucleotide sequence of VGAM1059 RNA, herein designated VGAM RNA, also designated SEQ ID:3770.

[38798] Another function of VGAM1059 is therefore inhibition of Vacuolar Protein Sorting 41 (yeast) (VPS41, Accession NM_014396). Accordingly, utilities of VGAM1059 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VPS41. BC022889 (Accession XM_096964) is another VGAM1059 host target gene. BC022889 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BC022889, corresponding to a HOST TARGET binding

site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BC022889 BINDING SITE, designated SEQ ID:40683, to the nucleotide sequence of VGAM1059 RNA, herein designated VGAM RNA, also designated SEQ ID:3770.

[38799] Another function of VGAM1059 is therefore inhibition of BC022889 (Accession XM_096964). Accordingly, utilities of VGAM1059 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BC022889. DKFZP434P0111 (Accession XM_041116) is another VGAM1059 host target gene. DKFZP434P0111 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP434P0111, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434P0111 BINDING SITE, designated SEQ ID:33455, to the nucleotide sequence of VGAM1059 RNA, herein designated VGAM RNA, also designated SEQ ID:3770.

[38800] Another function of VGAM1059 is therefore inhibition of DKFZP434P0111 (Accession XM_041116). Accordingly,

utilities of VGAM1059 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434P0111. F-box Only Protein 9 (FBXO9, Accession NM_033480) is another VGAM1059 host target gene. FBXO9 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FBXO9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FBXO9 BINDING SITE, designated SEQ ID:27256, to the nucleotide sequence of VGAM1059 RNA, herein designated VGAM RNA, also designated SEQ ID:3770.

[38801] Another function of VGAM1059 is therefore inhibition of F-box Only Protein 9 (FBXO9, Accession NM_033480). Accordingly, utilities of VGAM1059 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FBXO9. FLJ00001 (Accession XM_088525) is another VGAM1059 host target gene. FLJ00001 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ00001, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of FLJ00001 BINDING SITE, designated SEQ ID:39787, to the nucleotide sequence of VGAM1059 RNA, herein designated VGAM RNA, also designated SEQ ID:3770.

[38802] Another function of VGAM1059 is therefore inhibition of FLJ00001 (Accession XM_088525). Accordingly, utilities of VGAM1059 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ00001. FLJ10420 (Accession NM_018090) is another VGAM1059 host target gene. FLJ10420 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10420, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10420 BINDING SITE, designated SEQ ID:19857, to the nucleotide sequence of VGAM1059 RNA, herein designated VGAM RNA, also designated SEQ ID:3770.

[38803] Another function of VGAM1059 is therefore inhibition of FLJ10420 (Accession NM_018090). Accordingly, utilities of VGAM1059 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10420. FLJ11175 (Accession NM_018349) is another

VGAM1059 host target gene. FLJ11175 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ11175, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11175 BINDING SITE, designated SEQ ID:20362, to the nucleotide sequence of VGAM1059 RNA, herein designated VGAM RNA, also designated SEQ ID:3770.

[38804] Another function of VGAM1059 is therefore inhibition of FLJ11175 (Accession NM_018349). Accordingly, utilities of VGAM1059 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11175. FLJ12747 (Accession NM_032173) is another VGAM1059 host target gene. FLJ12747 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ12747, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12747 BINDING SITE, designated SEQ ID:25879, to the nucleotide sequence of VGAM1059 RNA, herein designated VGAM RNA, also designated SEQ ID:3770.

[38805] Another function of VGAM1059 is therefore inhibition of FLJ12747 (Accession NM_032173). Accordingly, utilities of VGAM1059 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12747. FLJ22679 (Accession NM_032227) is another VGAM1059 host target gene. FLJ22679 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ22679, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22679 BINDING SITE, designated SEQ ID:25952, to the nucleotide sequence of VGAM1059 RNA, herein designated VGAM RNA, also designated SEQ ID:3770.

[38806] Another function of VGAM1059 is therefore inhibition of FLJ22679 (Accession NM_032227). Accordingly, utilities of VGAM1059 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22679. GEMIN7 (Accession NM_024707) is another VGAM1059 host target gene. GEMIN7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GEMIN7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GEMIN7 BINDING SITE, designated SEQ ID:24023, to the nucleotide sequence of VGAM1059 RNA, herein designated VGAM RNA, also designated SEQ ID:3770.

[38807] Another function of VGAM1059 is therefore inhibition of GEMIN7 (Accession NM_024707). Accordingly, utilities of VGAM1059 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GEMIN7. Hypermethylated In Cancer 2 (HIC2, Accession XM_036937) is another VGAM1059 host target gene. HIC2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HIC2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HIC2 BINDING SITE, designated SEQ ID:32528, to the nucleotide sequence of VGAM1059 RNA, herein designated VGAM RNA, also designated SEQ ID:3770.

[38808] Another function of VGAM1059 is therefore inhibition of Hypermethylated In Cancer 2 (HIC2, Accession XM_036937). Accordingly, utilities of VGAM1059 include diagnosis, prevention and treatment of diseases and clinical

cal conditions associated with HIC2. KIAA0237 (Accession NM_014747) is another VGAM1059 host target gene. KIAA0237 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0237, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0237 BINDING SITE, designated SEQ ID:16455, to the nucleotide sequence of VGAM1059 RNA, herein designated VGAM RNA, also designated SEQ ID:3770.

[38809] Another function of VGAM1059 is therefore inhibition of KIAA0237 (Accession NM_014747). Accordingly, utilities of VGAM1059 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0237. KIAA0459 (Accession XM_027862) is another VGAM1059 host target gene. KIAA0459 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0459, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0459 BINDING SITE, designated SEQ ID:30579, to the

nucleotide sequence of VGAM1059 RNA, herein designated VGAM RNA, also designated SEQ ID:3770.

[38810] Another function of VGAM1059 is therefore inhibition of KIAA0459 (Accession XM_027862). Accordingly, utilities of VGAM1059 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0459. KIAA0493 (Accession XM_034717) is another VGAM1059 host target gene. KIAA0493 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0493, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0493 BINDING SITE, designated SEQ ID:32144, to the nucleotide sequence of VGAM1059 RNA, herein designated VGAM RNA, also designated SEQ ID:3770.

[38811] Another function of VGAM1059 is therefore inhibition of KIAA0493 (Accession XM_034717). Accordingly, utilities of VGAM1059 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0493. KIAA0682 (Accession NM_014852) is another VGAM1059 host target gene. KIAA0682 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by KIAA0682, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0682 BINDING SITE, designated SEQ ID:16903, to the nucleotide sequence of VGAM1059 RNA, herein designated VGAM RNA, also designated SEQ ID:3770.

[38812] Another function of VGAM1059 is therefore inhibition of KIAA0682 (Accession NM_014852). Accordingly, utilities of VGAM1059 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0682. KIAA0763 (Accession NM_014869) is another VGAM1059 host target gene. KIAA0763 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0763, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0763 BINDING SITE, designated SEQ ID:16968, to the nucleotide sequence of VGAM1059 RNA, herein designated VGAM RNA, also designated SEQ ID:3770.

[38813] Another function of VGAM1059 is therefore inhibition of KIAA0763 (Accession NM_014869). Accordingly, utilities

of VGAM1059 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0763. KIAA1463 (Accession XM_051160) is another VGAM1059 host target gene. KIAA1463 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1463, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1463 BINDING SITE, designated SEQ ID:35773, to the nucleotide sequence of VGAM1059 RNA, herein designated VGAM RNA, also designated SEQ ID:3770.

[38814] Another function of VGAM1059 is therefore inhibition of KIAA1463 (Accession XM_051160). Accordingly, utilities of VGAM1059 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1463. Lysyl Oxidase-like 4 (LOXL4, Accession NM_032211) is another VGAM1059 host target gene. LOXL4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOXL4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-

quences of LOXL4 BINDING SITE, designated SEQ ID:25926, to the nucleotide sequence of VGAM1059 RNA, herein designated VGAM RNA, also designated SEQ ID:3770.

[38815] Another function of VGAM1059 is therefore inhibition of Lysyl Oxidase-like 4 (LOXL4, Accession NM_032211). Accordingly, utilities of VGAM1059 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOXL4. MBLL39 (Accession NM_144778) is another VGAM1059 host target gene. MBLL39 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MBLL39, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MBLL39 BINDING SITE, designated SEQ ID:29575, to the nucleotide sequence of VGAM1059 RNA, herein designated VGAM RNA, also designated SEQ ID:3770.

[38816] Another function of VGAM1059 is therefore inhibition of MBLL39 (Accession NM_144778). Accordingly, utilities of VGAM1059 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MBLL39. PP2447 (Accession NM_025204) is another

VGAM1059 host target gene. PP2447 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PP2447, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PP2447 BINDING SITE, designated SEQ ID:24870, to the nucleotide sequence of VGAM1059 RNA, herein designated VGAM RNA, also designated SEQ ID:3770.

[38817] Another function of VGAM1059 is therefore inhibition of PP2447 (Accession NM_025204). Accordingly, utilities of VGAM1059 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PP2447. PRO1331 (Accession NM_030778) is another VGAM1059 host target gene. PRO1331 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRO1331, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO1331 BINDING SITE, designated SEQ ID:25068, to the nucleotide sequence of VGAM1059 RNA, herein designated VGAM RNA, also designated SEQ ID:3770.

[38818] Another function of VGAM1059 is therefore inhibition of PRO1331 (Accession NM_030778). Accordingly, utilities of VGAM1059 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO1331. Ribosomal Protein S6 Kinase, 90kDa, Polypeptide 4 (RPS6KA4, Accession NM_003942) is another VGAM1059 host target gene. RPS6KA4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RPS6KA4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RPS6KA4 BINDING SITE, designated SEQ ID:10055, to the nucleotide sequence of VGAM1059 RNA, herein designated VGAM RNA, also designated SEQ ID:3770.

[38819] Another function of VGAM1059 is therefore inhibition of Ribosomal Protein S6 Kinase, 90kDa, Polypeptide 4 (RPS6KA4, Accession NM_003942). Accordingly, utilities of VGAM1059 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RPS6KA4. SCYD1 (Accession XM_165650) is another VGAM1059 host target gene. SCYD1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region

of mRNA encoded by SCYD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCYD1 BINDING SITE, designated SEQ ID:43707, to the nucleotide sequence of VGAM1059 RNA, herein designated VGAM RNA, also designated SEQ ID:3770.

[38820] Another function of VGAM1059 is therefore inhibition of SCYD1 (Accession XM_165650). Accordingly, utilities of VGAM1059 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCYD1. SPARC-like 1 (mast9, hevin) (SPARCL1, Accession NM_004684) is another VGAM1059 host target gene. SPARCL1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SPARCL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SPARCL1 BINDING SITE, designated SEQ ID:11046, to the nucleotide sequence of VGAM1059 RNA, herein designated VGAM RNA, also designated SEQ ID:3770.

[38821] Another function of VGAM1059 is therefore inhibition of

SPARC-like 1 (mast9, hevin) (SPARCL1, Accession NM_004684). Accordingly, utilities of VGAM1059 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SPARCL1. Triple Homeobox 1 (TIX1, Accession XM_029734) is another VGAM1059 host target gene. TIX1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TIX1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TIX1 BINDING SITE, designated SEQ ID:30931, to the nucleotide sequence of VGAM1059 RNA, herein designated VGAM RNA, also designated SEQ ID:3770.

[38822] Another function of VGAM1059 is therefore inhibition of Triple Homeobox 1 (TIX1, Accession XM_029734). Accordingly, utilities of VGAM1059 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TIX1. TNF Receptor-associated Factor 3 (TRAF3, Accession XM_007256) is another VGAM1059 host target gene. TRAF3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRAF3, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRAF3 BINDING SITE, designated SEQ ID:30044, to the nucleotide sequence of VGAM1059 RNA, herein designated VGAM RNA, also designated SEQ ID:3770.

[38823] Another function of VGAM1059 is therefore inhibition of TNF Receptor-associated Factor 3 (TRAF3, Accession XM_007256). Accordingly, utilities of VGAM1059 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRAF3. LOC115219 (Accession XM_055499) is another VGAM1059 host target gene. LOC115219 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC115219, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC115219 BINDING SITE, designated SEQ ID:36278, to the nucleotide sequence of VGAM1059 RNA, herein designated VGAM RNA, also designated SEQ ID:3770.

[38824] Another function of VGAM1059 is therefore inhibition of LOC115219 (Accession XM_055499). Accordingly, utilities

of VGAM1059 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115219. LOC133418 (Accession XM_059649) is another VGAM1059 host target gene. LOC133418 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC133418, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC133418 BINDING SITE, designated SEQ ID:37039, to the nucleotide sequence of VGAM1059 RNA, herein designated VGAM RNA, also designated SEQ ID:3770.

[38825] Another function of VGAM1059 is therefore inhibition of LOC133418 (Accession XM_059649). Accordingly, utilities of VGAM1059 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC133418. LOC143173 (Accession XM_016685) is another VGAM1059 host target gene. LOC143173 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC143173, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC143173 BINDING SITE, designated SEQ ID:30273, to the nucleotide sequence of VGAM1059 RNA, herein designated VGAM RNA, also designated SEQ ID:3770.

[38826] Another function of VGAM1059 is therefore inhibition of LOC143173 (Accession XM_016685). Accordingly, utilities of VGAM1059 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143173. LOC149837 (Accession XM_097747) is another VGAM1059 host target gene. LOC149837 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC149837, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149837 BINDING SITE, designated SEQ ID:41102, to the nucleotide sequence of VGAM1059 RNA, herein designated VGAM RNA, also designated SEQ ID:3770.

[38827] Another function of VGAM1059 is therefore inhibition of LOC149837 (Accession XM_097747). Accordingly, utilities of VGAM1059 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149837. LOC150271 (Accession XM_097859) is another VGAM1059 host target gene. LOC150271 BINDING

SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150271, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150271 BINDING SITE, designated SEQ ID:41169, to the nucleotide sequence of VGAM1059 RNA, herein designated VGAM RNA, also designated SEQ ID:3770.

[38828] Another function of VGAM1059 is therefore inhibition of LOC150271 (Accession XM_097859). Accordingly, utilities of VGAM1059 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150271. LOC151318 (Accession XM_087170) is another VGAM1059 host target gene. LOC151318 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC151318, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151318 BINDING SITE, designated SEQ ID:39105, to the nucleotide sequence of VGAM1059 RNA, herein designated VGAM RNA, also designated SEQ ID:3770.

[38829] Another function of VGAM1059 is therefore inhibition of

LOC151318 (Accession XM_087170). Accordingly, utilities of VGAM1059 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151318. LOC158987 (Accession XM_099015) is another VGAM1059 host target gene. LOC158987 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC158987, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158987 BINDING SITE, designated SEQ ID:42050, to the nucleotide sequence of VGAM1059 RNA, herein designated VGAM RNA, also designated SEQ ID:3770.

[38830] Another function of VGAM1059 is therefore inhibition of LOC158987 (Accession XM_099015). Accordingly, utilities of VGAM1059 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158987. LOC220954 (Accession XM_167628) is another VGAM1059 host target gene. LOC220954 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC220954, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC220954 BINDING SITE, designated SEQ ID:44737, to the nucleotide sequence of VGAM1059 RNA, herein designated VGAM RNA, also designated SEQ ID:3770.

[38831] Another function of VGAM1059 is therefore inhibition of LOC220954 (Accession XM_167628). Accordingly, utilities of VGAM1059 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220954. LOC254532 (Accession XM_172961) is another VGAM1059 host target gene. LOC254532 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC254532, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254532 BINDING SITE, designated SEQ ID:46209, to the nucleotide sequence of VGAM1059 RNA, herein designated VGAM RNA, also designated SEQ ID:3770.

[38832] Another function of VGAM1059 is therefore inhibition of LOC254532 (Accession XM_172961). Accordingly, utilities of VGAM1059 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254532. LOC255598 (Accession XM_173715) is an-

other VGAM1059 host target gene. LOC255598 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC255598, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255598 BINDING SITE, designated SEQ ID:46559, to the nucleotide sequence of VGAM1059 RNA, herein designated VGAM RNA, also designated SEQ ID:3770.

[38833] Another function of VGAM1059 is therefore inhibition of LOC255598 (Accession XM_173715). Accordingly, utilities of VGAM1059 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255598. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1060 (VGAM1060) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[38834] VGAM1060 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1060 was detected is de-

scribed hereinabove with reference to Figs. 1–8.

[38835] VGAM1060 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Potato Mop–top Virus.

VGAM1060 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[38836] VGAM1060 gene encodes a VGAM1060 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1060 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1060 precursor RNA is designated SEQ ID:1046, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1046 is located at position 2755 relative to the genome of Potato Mop–top Virus.

[38837] VGAM1060 precursor RNA folds onto itself, forming VGAM1060 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two–dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA

gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[38838] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1060 folded precursor RNA into VGAM1060 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM1060 RNA is designated SEQ ID:3771, and is provided hereinbelow with reference to the sequence listing part.

[38839] VGAM1060 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1060 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1060 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[38840] VGAM1060 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM1060 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1060 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1060 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1060 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[38841] The complementary binding of VGAM1060 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1060 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1060 host target RNA into VGAM1060 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[38842] It is appreciated that VGAM1060 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1060 host target genes. The mRNA of each one of this plurality of VGAM1060 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1060 RNA, herein designated VGAM RNA, and which when bound by VGAM1060 RNA causes inhibition of translation of respective one or more VGAM1060 host target proteins.

[38843] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1060 gene, herein designated VGAM GENE, on one or more VGAM1060 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[38844] It is yet further appreciated that a function of VGAM1060 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1060 include diagnosis, prevention and treatment of viral infection by Potato Mop-top Virus. Specific functions, and accordingly utilities, of VGAM1060 correlate with, and may be deduced from, the identity of the host target genes which VGAM1060 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[38845] Nucleotide sequences of the VGAM1060 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1060 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding

of VGAM1060 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1060 are further described hereinbelow with reference to Table 1.

[38846] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1060 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1060 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[38847] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1060 gene, herein designated VGAM is inhibition of expression of VGAM1060 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1060 correlate with, and may be deduced from, the identity of the target genes which VGAM1060 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[38848] Protocadherin Alpha 1 (PCDHA1, Accession NM_031411) is a VGAM1060 host target gene. PCDHA1 BINDING SITE1 and PCDHA1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PCDHA1, corresponding to HOST TARGET binding sites

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHA1 BINDING SITE1 and PCDHA1 BINDING SITE2, designated SEQ ID:25381 and SEQ ID:20862 respectively, to the nucleotide sequence of VGAM1060 RNA, herein designated VGAM RNA, also designated SEQ ID:3771.

[38849] A function of VGAM1060 is therefore inhibition of Protocadherin Alpha 1 (PCDHA1, Accession NM_031411). Accordingly, utilities of VGAM1060 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHA1. Protocadherin Alpha 10 (PCDHA10, Accession NM_031860) is another VGAM1060 host target gene. PCDHA10 BINDING SITE1 and PCDHA10 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PCDHA10, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHA10 BINDING SITE1 and PCDHA10 BINDING SITE2, designated SEQ ID:25613 and SEQ ID:20882 respectively, to the nucleotide sequence of VGAM1060 RNA, herein designated VGAM RNA, also designated SEQ ID:3771.

[38850] Another function of VGAM1060 is therefore inhibition of Protocadherin Alpha 10 (PCDHA10, Accession NM_031860). Accordingly, utilities of VGAM1060 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHA10. Protocadherin Alpha 13 (PCDHA13, Accession NM_018904) is another VGAM1060 host target gene. PCDHA13 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PCDHA13, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHA13 BINDING SITE, designated SEQ ID:20903, to the nucleotide sequence of VGAM1060 RNA, herein designated VGAM RNA, also designated SEQ ID:3771.

[38851] Another function of VGAM1060 is therefore inhibition of Protocadherin Alpha 13 (PCDHA13, Accession NM_018904). Accordingly, utilities of VGAM1060 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHA13. Protocadherin Alpha 2 (PCDHA2, Accession NM_018905) is another VGAM1060 host target gene. PCDHA2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by PCDHA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHA2 BINDING SITE, designated SEQ ID:20913, to the nucleotide sequence of VGAM1060 RNA, herein designated VGAM RNA, also designated SEQ ID:3771.

[38852] Another function of VGAM1060 is therefore inhibition of Protocadherin Alpha 2 (PCDHA2, Accession NM_018905). Accordingly, utilities of VGAM1060 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHA2. Protocadherin Alpha 3 (PCDHA3, Accession NM_018906) is another VGAM1060 host target gene. PCDHA3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PCDHA3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHA3 BINDING SITE, designated SEQ ID:20923, to the nucleotide sequence of VGAM1060 RNA, herein designated VGAM RNA, also designated SEQ ID:3771.

[38853] Another function of VGAM1060 is therefore inhibition of

Protocadherin Alpha 3 (PCDHA3, Accession NM_018906). Accordingly, utilities of VGAM1060 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHA3. Protocadherin Alpha 4 (PCDHA4, Accession NM_018907) is another VGAM1060 host target gene. PCDHA4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PCDHA4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHA4 BINDING SITE, designated SEQ ID:20933, to the nucleotide sequence of VGAM1060 RNA, herein designated VGAM RNA, also designated SEQ ID:3771.

[38854] Another function of VGAM1060 is therefore inhibition of Protocadherin Alpha 4 (PCDHA4, Accession NM_018907). Accordingly, utilities of VGAM1060 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHA4. Protocadherin Alpha 5 (PCDHA5, Accession NM_018908) is another VGAM1060 host target gene. PCDHA5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PCDHA5, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHA5 BINDING SITE, designated SEQ ID:20943, to the nucleotide sequence of VGAM1060 RNA, herein designated VGAM RNA, also designated SEQ ID:3771.

[38855] Another function of VGAM1060 is therefore inhibition of Protocadherin Alpha 5 (PCDHA5, Accession NM_018908). Accordingly, utilities of VGAM1060 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHA5. Protocadherin Alpha 6 (PCDHA6, Accession NM_018909) is another VGAM1060 host target gene. PCDHA6 BINDING SITE1 and PCDHA6 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PCDHA6, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHA6 BINDING SITE1 and PCDHA6 BINDING SITE2, designated SEQ ID:20953 and SEQ ID:25585 respectively, to the nucleotide sequence of VGAM1060 RNA, herein designated VGAM RNA, also designated SEQ ID:3771.

[38856] Another function of VGAM1060 is therefore inhibition of

Protocadherin Alpha 6 (PCDHA6, Accession NM_018909). Accordingly, utilities of VGAM1060 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHA6. Protocadherin Alpha 8 (PCDHA8, Accession NM_018911) is another VGAM1060 host target gene. PCDHA8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PCDHA8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHA8 BINDING SITE, designated SEQ ID:20973, to the nucleotide sequence of VGAM1060 RNA, herein designated VGAM RNA, also designated SEQ ID:3771.

[38857] Another function of VGAM1060 is therefore inhibition of Protocadherin Alpha 8 (PCDHA8, Accession NM_018911). Accordingly, utilities of VGAM1060 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHA8. Protocadherin Alpha 9 (PCDHA9, Accession NM_031857) is another VGAM1060 host target gene. PCDHA9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PCDHA9, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHA9 BINDING SITE, designated SEQ ID:25598, to the nucleotide sequence of VGAM1060 RNA, herein designated VGAM RNA, also designated SEQ ID:3771.

[38858] Another function of VGAM1060 is therefore inhibition of Protocadherin Alpha 9 (PCDHA9, Accession NM_031857), a gene which is a calcium-dependent cell-adhesion protein. Accordingly, utilities of VGAM1060 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHA9. The function of PCDHA9 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM71. Protocadherin Alpha Subfamily C, 1 (PCDHAC1, Accession NM_018898) is another VGAM1060 host target gene. PCDHAC1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PCDHAC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHAC1 BINDING SITE, designated

SEQ ID:20842, to the nucleotide sequence of VGAM1060 RNA, herein designated VGAM RNA, also designated SEQ ID:3771.

[38859] Another function of VGAM1060 is therefore inhibition of Protocadherin Alpha Subfamily C, 1 (PCDHAC1, Accession NM_018898). Accordingly, utilities of VGAM1060 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHAC1. Protocadherin Alpha Subfamily C, 2 (PCDHAC2, Accession NM_018899) is another VGAM1060 host target gene. PCDHAC2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PCDHAC2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHAC2 BINDING SITE, designated SEQ ID:20852, to the nucleotide sequence of VGAM1060 RNA, herein designated VGAM RNA, also designated SEQ ID:3771.

[38860] Another function of VGAM1060 is therefore inhibition of Protocadherin Alpha Subfamily C, 2 (PCDHAC2, Accession NM_018899). Accordingly, utilities of VGAM1060 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHAC2. Replication Pro-

tein A2, 32kDa (RPA2, Accession NM_002946) is another VGAM1060 host target gene. RPA2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RPA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RPA2 BINDING SITE, designated SEQ ID:8857, to the nucleotide sequence of VGAM1060 RNA, herein designated VGAM RNA, also designated SEQ ID:3771.

[38861] Another function of VGAM1060 is therefore inhibition of Replication Protein A2, 32kDa (RPA2, Accession NM_002946). Accordingly, utilities of VGAM1060 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RPA2. FLJ20079 (Accession NM_017656) is another VGAM1060 host target gene. FLJ20079 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20079, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20079 BINDING SITE, designated SEQ ID:19168, to the nucleotide sequence of VGAM1060 RNA,

herein designated VGAM RNA, also designated SEQ ID:3771.

[38862] Another function of VGAM1060 is therefore inhibition of FLJ20079 (Accession NM_017656). Accordingly, utilities of VGAM1060 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20079. G-protein Coupled Receptor 88 (GPR88, Accession NM_022049) is another VGAM1060 host target gene. GPR88 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GPR88, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GPR88 BINDING SITE, designated SEQ ID:22574, to the nucleotide sequence of VGAM1060 RNA, herein designated VGAM RNA, also designated SEQ ID:3771.

[38863] Another function of VGAM1060 is therefore inhibition of G-protein Coupled Receptor 88 (GPR88, Accession NM_022049). Accordingly, utilities of VGAM1060 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPR88. LOC116064 (Accession XM_057296) is another VGAM1060 host target

gene. LOC116064 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC116064, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC116064 BINDING SITE, designated SEQ ID:36498, to the nucleotide sequence of VGAM1060 RNA, herein designated VGAM RNA, also designated SEQ ID:3771.

[38864] Another function of VGAM1060 is therefore inhibition of LOC116064 (Accession XM_057296). Accordingly, utilities of VGAM1060 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC116064. LOC168448 (Accession XM_095105) is another VGAM1060 host target gene. LOC168448 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC168448, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC168448 BINDING SITE, designated SEQ ID:40246, to the nucleotide sequence of VGAM1060 RNA, herein designated VGAM RNA, also designated SEQ ID:3771.

[38865] Another function of VGAM1060 is therefore inhibition of LOC168448 (Accession XM_095105). Accordingly, utilities of VGAM1060 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC168448. LOC220477 (Accession XM_071675) is another VGAM1060 host target gene. LOC220477 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC220477, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220477 BINDING SITE, designated SEQ ID:37411, to the nucleotide sequence of VGAM1060 RNA, herein designated VGAM RNA, also designated SEQ ID:3771.

[38866] Another function of VGAM1060 is therefore inhibition of LOC220477 (Accession XM_071675). Accordingly, utilities of VGAM1060 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220477. LOC83693 (Accession NM_031463) is another VGAM1060 host target gene. LOC83693 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC83693, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC83693 BINDING SITE, designated SEQ ID:25499, to the nucleotide sequence of VGAM1060 RNA, herein designated VGAM RNA, also designated SEQ ID:3771.

[38867] Another function of VGAM1060 is therefore inhibition of LOC83693 (Accession NM_031463). Accordingly, utilities of VGAM1060 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC83693. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1061 (VGAM1061) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[38868] VGAM1061 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1061 was detected is described hereinabove with reference to Figs. 1–8.

[38869] VGAM1061 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Canine Adenovirus Type 1. VGAM1061 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[38870] VGAM1061 gene encodes a VGAM1061 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1061 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1061 precursor RNA is designated SEQ ID:1047, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1047 is located at position 7412 relative to the genome of Canine Adenovirus Type 1.

[38871] VGAM1061 precursor RNA folds onto itself, forming VGAM1061 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[38872] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1061 folded precursor RNA into VGAM1061

RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 48%) nucleotide sequence of VGAM1061 RNA is designated SEQ ID:3772, and is provided hereinbelow with reference to the sequence listing part.

[38873] VGAM1061 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1061 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1061 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[38874] VGAM1061 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1061 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1061 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1061 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1061 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[38875] The complementary binding of VGAM1061 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1061 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1061 host target RNA into VGAM1061 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM

host target protein is therefore outlined by a broken line.

[38876] It is appreciated that VGAM1061 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1061 host target genes. The mRNA of each one of this plurality of VGAM1061 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1061 RNA, herein designated VGAM RNA, and which when bound by VGAM1061 RNA causes inhibition of translation of respective one or more VGAM1061 host target proteins.

[38877] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1061 gene, herein designated VGAM GENE, on one or more VGAM1061 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[38878] It is yet further appreciated that a function of VGAM1061 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1061 include diagnosis, prevention and treatment of viral infection by Canine Adenovirus Type 1. Specific functions, and accordingly utilities, of VGAM1061 correlate with, and may be deduced from, the identity of the host target genes which VGAM1061 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[38879] Nucleotide sequences of the VGAM1061 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1061 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1061 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1061 are further described hereinbelow with reference to Table 1.

[38880] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1061 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1061 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[38881] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1061 gene, herein designated VGAM is inhibition of expression of VGAM1061 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1061 correlate with, and may be deduced from, the identity of the target genes which VGAM1061 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[38882] Inositol Hexaphosphate Kinase 1 (IHPK1, Accession XM_171045) is a VGAM1061 host target gene. IHPK1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IHPK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IHPK1 BINDING SITE, designated SEQ ID:45821, to the nucleotide sequence of VGAM1061 RNA, herein designated

VGAM RNA, also designated SEQ ID:3772.

[38883] A function of VGAM1061 is therefore inhibition of Inositol Hexaphosphate Kinase 1 (IHPK1, Accession XM_171045), a gene which is a messenger molecule that releases calcium from intracellular stores. Accordingly, utilities of VGAM1061 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IHPK1. The function of IHPK1 has been established by previous studies. Inositol trisphosphate is a messenger molecule that releases calcium from intracellular stores. Homologs with multiple phosphates, including pyrophosphates, have also been identified. Inositol pyrophosphates are formed by several enzymes, including IHPK1. By screening an immature myeloid cell line for cDNAs with the potential to encode large proteins, Nagase et al. (1996) identified a cDNA encoding IHPK1, which they called KIAA0263, a deduced 462-amino acid protein. Northern blot analysis detected ubiquitous, low-level expression that was highest in testis. By comparison with rat *lhpk1* and database searching, Saiardi et al. (1999) identified mouse *lhpk1*, which is 97% homologous to KIAA0263. Western blot analysis showed expression of a 50-kD protein. Northern blot analysis revealed expression of a 5.0-kb transcript in

mouse brain and testis, with much lower levels in heart, liver, kidney, lung, and spleen. Using confocal microscopy, Saiardi et al. (2001) demonstrated that mouse Ihpk1 is present in both the nucleus and the cytoplasm, whereas IHPK2 is almost exclusively nuclear and IHPK3 (OMIM Ref. No. 606993) is predominantly cytoplasmic. Saiardi et al. (1999) showed that cells expressing Ihpk1 displayed a robust InsP6 kinase activity. They proposed that IHPK1 and IHPK2 (OMIM Ref. No. 606992) may act as energy reserves in selected intracellular sites.

[38884] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[38885] Saiardi, A.; Erdjument-Bromage, H.; Snowman, A. M.; Tempst, P.; Snyder, S. H. : Synthesis of diphosphoinositol pentakisphosphate by a newly identified family of higher inositol polyphosphate kinases. *Curr. Biol.* 9: 1323–1326, 1999. ; and

[38886] Saiardi, A.; Nagata, E.; Luo, H. R.; Snowman, A. M.; Snyder, S. H. : Identification and characterization of a novel inositol hexakisphosphate kinase. *J. Biol. Chem.* 276: 39179–39185, 20.

[38887] Further studies establishing the function and utilities of

IHPK1 are found in John Hopkins OMIM database record ID 606991, and in cited publications numbered 9011–6162 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Muscleblind-like (Drosophila) (MBNL, Accession NM_021038) is another VGAM1061 host target gene. MBNL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MBNL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MBNL BINDING SITE, designated SEQ ID:22032, to the nucleotide sequence of VGAM1061 RNA, herein designated VGAM RNA, also designated SEQ ID:3772.

[38888] Another function of VGAM1061 is therefore inhibition of Muscleblind-like (Drosophila) (MBNL, Accession NM_021038), a gene which binds to cug triplet repeat expansion dsrna (by similarity). Accordingly, utilities of VGAM1061 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MBNL. The function of MBNL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference

to VGAM95.SET Translocation (myeloid leukemia-associated) (SET, Accession NM_003011) is another VGAM1061 host target gene. SET BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SET, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SET BINDING SITE, designated SEQ ID:8922, to the nucleotide sequence of VGAM1061 RNA, herein designated VGAM RNA, also designated SEQ ID:3772.

[38889] Another function of VGAM1061 is therefore inhibition of SET Translocation (myeloid leukemia-associated) (SET, Accession NM_003011). Accordingly, utilities of VGAM1061 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SET. Zinc Finger Protein 219 (ZNF219, Accession NM_016423) is another VGAM1061 host target gene. ZNF219 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ZNF219, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

ZNF219 BINDING SITE, designated SEQ ID:18546, to the nucleotide sequence of VGAM1061 RNA, herein designated VGAM RNA, also designated SEQ ID:3772.

[38890] Another function of VGAM1061 is therefore inhibition of Zinc Finger Protein 219 (ZNF219, Accession NM_016423). Accordingly, utilities of VGAM1061 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF219. Chromosome 6 Open Reading Frame 37 (C6orf37, Accession XM_041375) is another VGAM1061 host target gene. C6orf37 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C6orf37, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C6orf37 BINDING SITE, designated SEQ ID:33511, to the nucleotide sequence of VGAM1061 RNA, herein designated VGAM RNA, also designated SEQ ID:3772.

[38891] Another function of VGAM1061 is therefore inhibition of Chromosome 6 Open Reading Frame 37 (C6orf37, Accession XM_041375). Accordingly, utilities of VGAM1061 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C6orf37. ETAA16

(Accession NM_019002) is another VGAM1061 host target gene. ETAA16 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ETAA16, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ETAA16 BINDING SITE, designated SEQ ID:21073, to the nucleotide sequence of VGAM1061 RNA, herein designated VGAM RNA, also designated SEQ ID:3772.

[38892] Another function of VGAM1061 is therefore inhibition of ETAA16 (Accession NM_019002). Accordingly, utilities of VGAM1061 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ETAA16. FLJ21736 (Accession NM_024922) is another VGAM1061 host target gene. FLJ21736 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21736, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21736 BINDING SITE, designated SEQ ID:24459, to the nucleotide sequence of VGAM1061 RNA, herein designated VGAM

RNA, also designated SEQ ID:3772.

[38893] Another function of VGAM1061 is therefore inhibition of FLJ21736 (Accession NM_024922). Accordingly, utilities of VGAM1061 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21736. KIAA0420 (Accession XM_032693) is another VGAM1061 host target gene. KIAA0420 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0420, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0420 BINDING SITE, designated SEQ ID:31724, to the nucleotide sequence of VGAM1061 RNA, herein designated VGAM RNA, also designated SEQ ID:3772.

[38894] Another function of VGAM1061 is therefore inhibition of KIAA0420 (Accession XM_032693). Accordingly, utilities of VGAM1061 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0420. KIAA0644 (Accession NM_014817) is another VGAM1061 host target gene. KIAA0644 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0644, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0644 BINDING SITE, designated SEQ ID:16782, to the nucleotide sequence of VGAM1061 RNA, herein designated VGAM RNA, also designated SEQ ID:3772.

[38895] Another function of VGAM1061 is therefore inhibition of KIAA0644 (Accession NM_014817). Accordingly, utilities of VGAM1061 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0644. KIAA1796 (Accession XM_166146) is another VGAM1061 host target gene. KIAA1796 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1796, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1796 BINDING SITE, designated SEQ ID:43965, to the nucleotide sequence of VGAM1061 RNA, herein designated VGAM RNA, also designated SEQ ID:3772.

[38896] Another function of VGAM1061 is therefore inhibition of KIAA1796 (Accession XM_166146). Accordingly, utilities of VGAM1061 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA1796. Myristoylated Alanine-rich Protein Kinase C Substrate (MARCKS, Accession NM_002356) is another VGAM1061 host target gene. MARCKS BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MARCKS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MARCKS BINDING SITE, designated SEQ ID:8168, to the nucleotide sequence of VGAM1061 RNA, herein designated VGAM RNA, also designated SEQ ID:3772.

[38897] Another function of VGAM1061 is therefore inhibition of Myristoylated Alanine-rich Protein Kinase C Substrate (MARCKS, Accession NM_002356). Accordingly, utilities of VGAM1061 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MARCKS. MGC15634 (Accession NM_032755) is another VGAM1061 host target gene. MGC15634 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC15634, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of MGC15634 BINDING SITE, designated SEQ ID:26496, to the nucleotide sequence of VGAM1061 RNA, herein designated VGAM RNA, also designated SEQ ID:3772.

[38898] Another function of VGAM1061 is therefore inhibition of MGC15634 (Accession NM_032755). Accordingly, utilities of VGAM1061 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC15634. LOC130497 (Accession XM_059439) is another VGAM1061 host target gene. LOC130497 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC130497, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC130497 BINDING SITE, designated SEQ ID:36992, to the nucleotide sequence of VGAM1061 RNA, herein designated VGAM RNA, also designated SEQ ID:3772.

[38899] Another function of VGAM1061 is therefore inhibition of LOC130497 (Accession XM_059439). Accordingly, utilities of VGAM1061 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC130497. LOC133418 (Accession XM_059649) is an-

other VGAM1061 host target gene. LOC133418 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC133418, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC133418 BINDING SITE, designated SEQ ID:37040, to the nucleotide sequence of VGAM1061 RNA, herein designated VGAM RNA, also designated SEQ ID:3772.

[38900] Another function of VGAM1061 is therefore inhibition of LOC133418 (Accession XM_059649). Accordingly, utilities of VGAM1061 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC133418. LOC144231 (Accession XM_096561) is another VGAM1061 host target gene. LOC144231 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC144231, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144231 BINDING SITE, designated SEQ ID:40390, to the nucleotide sequence of VGAM1061 RNA, herein designated VGAM RNA, also designated SEQ ID:3772.

[38901] Another function of VGAM1061 is therefore inhibition of LOC144231 (Accession XM_096561). Accordingly, utilities of VGAM1061 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144231. LOC152426 (Accession XM_098225) is another VGAM1061 host target gene. LOC152426 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152426, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152426 BINDING SITE, designated SEQ ID:41497, to the nucleotide sequence of VGAM1061 RNA, herein designated VGAM RNA, also designated SEQ ID:3772.

[38902] Another function of VGAM1061 is therefore inhibition of LOC152426 (Accession XM_098225). Accordingly, utilities of VGAM1061 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152426. LOC165693 (Accession XM_093373) is another VGAM1061 host target gene. LOC165693 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC165693, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC165693 BINDING SITE, designated SEQ ID:40190, to the nucleotide sequence of VGAM1061 RNA, herein designated VGAM RNA, also designated SEQ ID:3772.

[38903] Another function of VGAM1061 is therefore inhibition of LOC165693 (Accession XM_093373). Accordingly, utilities of VGAM1061 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC165693. LOC221895 (Accession XM_166511) is another VGAM1061 host target gene. LOC221895 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221895, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221895 BINDING SITE, designated SEQ ID:44443, to the nucleotide sequence of VGAM1061 RNA, herein designated VGAM RNA, also designated SEQ ID:3772.

[38904] Another function of VGAM1061 is therefore inhibition of LOC221895 (Accession XM_166511). Accordingly, utilities of VGAM1061 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC221895. LOC257354 (Accession XM_170810) is another VGAM1061 host target gene. LOC257354 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC257354, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257354 BINDING SITE, designated SEQ ID:45577, to the nucleotide sequence of VGAM1061 RNA, herein designated VGAM RNA, also designated SEQ ID:3772.

[38905] Another function of VGAM1061 is therefore inhibition of LOC257354 (Accession XM_170810). Accordingly, utilities of VGAM1061 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257354. LOC257476 (Accession XM_028610) is another VGAM1061 host target gene. LOC257476 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC257476, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257476 BINDING SITE, designated SEQ ID:30713, to the nucleotide sequence of VGAM1061 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3772.

[38906] Another function of VGAM1061 is therefore inhibition of LOC257476 (Accession XM_028610). Accordingly, utilities of VGAM1061 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257476. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1062 (VGAM1062) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[38907] VGAM1062 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1062 was detected is described hereinabove with reference to Figs. 1–8.

[38908] VGAM1062 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Canine Adenovirus Type 1. VGAM1062 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[38909] VGAM1062 gene encodes a VGAM1062 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM1062 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1062 precursor RNA is designated SEQ ID:1048, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1048 is located at position 6331 relative to the genome of Canine Adenovirus Type 1.

[38910] VGAM1062 precursor RNA folds onto itself, forming VGAM1062 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[38911] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1062 folded precursor RNA into VGAM1062 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of VGAM1062 RNA is designated SEQ ID:3773, and is provided hereinbelow with reference to the sequence listing part.

[38912] VGAM1062 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1062 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1062 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[38913] VGAM1062 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1062 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1062 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1062 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1062 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[38914] The complementary binding of VGAM1062 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1062 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1062 host target RNA into VGAM1062 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[38915] It is appreciated that VGAM1062 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1062 host target genes. The mRNA of

each one of this plurality of VGAM1062 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1062 RNA, herein designated VGAM RNA, and which when bound by VGAM1062 RNA causes inhibition of translation of respective one or more VGAM1062 host target proteins.

[38916] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1062 gene, herein designated VGAM GENE, on one or more VGAM1062 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[38917] It is yet further appreciated that a function of VGAM1062 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1062 include diagnosis, prevention and treatment of viral infection by Canine Adenovirus Type 1. Specific functions, and accordingly utilities, of VGAM1062 correlate with, and may be deduced from, the identity of the host target genes which VGAM1062 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[38918] Nucleotide sequences of the VGAM1062 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1062 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1062 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1062 are further described hereinbelow with reference to Table 1.

[38919] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1062 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1062 RNA,

herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[38920] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1062 gene, herein designated VGAM is inhibition of expression of VGAM1062 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1062 correlate with, and may be deduced from, the identity of the target genes which VGAM1062 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[38921] Protein Phosphatase 1, Catalytic Subunit, Beta Isoform (PPP1CB, Accession NM_002709) is a VGAM1062 host target gene. PPP1CB BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PPP1CB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP1CB BINDING SITE, designated SEQ ID:8562, to the nucleotide sequence of VGAM1062 RNA, herein designated VGAM RNA, also designated SEQ ID:3773.

[38922] A function of VGAM1062 is therefore inhibition of Protein Phosphatase 1, Catalytic Subunit, Beta Isoform (PPP1CB,

Accession NM_002709), a gene which is the catalytic subunit of protein phosphatase 1. Accordingly, utilities of VGAM1062 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP1CB. The function of PPP1CB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM46.PRO0082 (Accession NM_018590) is another VGAM1062 host target gene. PRO0082 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRO0082, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO0082 BINDING SITE, designated SEQ ID:20669, to the nucleotide sequence of VGAM1062 RNA, herein designated VGAM RNA, also designated SEQ ID:3773.

[38923] Another function of VGAM1062 is therefore inhibition of PRO0082 (Accession NM_018590). Accordingly, utilities of VGAM1062 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO0082. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 1063 (VGAM1063) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[38924] VGAM1063 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1063 was detected is described hereinabove with reference to Figs. 1–8.

[38925] VGAM1063 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tulip Virus X. VGAM1063 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[38926] VGAM1063 gene encodes a VGAM1063 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1063 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1063 precursor RNA is designated SEQ ID:1049, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1049 is located at position 2404 relative to the

genome of Tulip Virus X.

[38927] VGAM1063 precursor RNA folds onto itself, forming VGAM1063 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[38928] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1063 folded precursor RNA into VGAM1063 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1063 RNA is designated SEQ ID:3774, and is provided hereinbelow with reference to the sequence listing part.

[38929] VGAM1063 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM1063 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1063 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[38930] VGAM1063 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1063 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1063 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1063 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1063 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[38931] The complementary binding of VGAM1063 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1063 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1063 host target RNA into VGAM1063 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[38932] It is appreciated that VGAM1063 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1063 host target genes. The mRNA of each one of this plurality of VGAM1063 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1063 RNA, herein designated VGAM RNA, and which when bound by VGAM1063 RNA causes inhibition of translation of respective one or more VGAM1063 host target proteins.

[38933] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1063 gene, herein designated VGAM GENE, on one or more VGAM1063 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[38934] It is yet further appreciated that a function of VGAM1063 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1063 include diagnosis, prevention and treatment of viral infection by Tulip Virus X. Specific functions, and accordingly utilities, of VGAM1063 correlate

with, and may be deduced from, the identity of the host target genes which VGAM1063 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[38935] Nucleotide sequences of the VGAM1063 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1063 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1063 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1063 are further described hereinbelow with reference to Table 1.

[38936] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1063 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1063 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[38937] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1063 gene, herein designated VGAM is inhibition of expression of VGAM1063 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1063 correlate with, and may be deduced

from, the identity of the target genes which VGAM1063 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[38938] Agrin (AGRN, Accession XM_086178) is a VGAM1063 host target gene. AGRN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AGRN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AGRN BINDING SITE, designated SEQ ID:38534, to the nucleotide sequence of VGAM1063 RNA, herein designated VGAM RNA, also designated SEQ ID:3774.

[38939] A function of VGAM1063 is therefore inhibition of Agrin (AGRN, Accession XM_086178), a gene which a neuronal aggregating factor that induces the aggregation of acetylcholine receptors . Accordingly, utilities of VGAM1063 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AGRN. The function of AGRN has been established by previous studies. Agrin is a neuronal aggregating factor that induces the aggregation of acetylcholine receptors and other postsynaptic proteins on muscle fibers and is crucial for the formation of the

neuromuscular junction. Rupp et al. (1991) isolated cDNAs from a rat embryonic spinal cord library using an agrin cDNA clone isolated from electromotor neurons of a marine ray. Analysis of a set of clones predicted a protein with 1,940 amino acids, including 141 cysteine residues. The predicted protein had 9 domains homologous to protease inhibitors, a region similar to domain III of laminin (see OMIM Ref. No. 150240), and 4 epidermal growth factor (OMIM Ref. No. 131530) repeats. The gene was expressed in rat embryonic nervous system and muscle. The protein was concentrated at synapses. Rupp et al. (1992) described alternative RNA splicing in mammalian agrin resulting in many extracellular matrix protein isoforms. Rupp et al. (1992) mapped the human AGRN gene to 1pter-p32 by analysis of Chinese hamster/human somatic cell hybrids, including one that carried chromosome 1 region p32-qter (which was negative for the human signal). The mouse gene was mapped to chromosome 4 by study of Chinese hamster/mouse somatic cell hybrids. Thus, this is another example of extensive homology of synteny between 1pter-p32 and the distal half of mouse chromosome 4. Three neurologic mutants in that region of mouse chromosome 4 were pointed to as possible candidate dis-

eases for mutations in the Agrn gene. Animal model experiments lend further support to the function of AGRN. To test critically the 'agrin hypothesis' (McMahan, 1990), Gautam et al. (1996) generated knockout mice deficient for agrin and showed that neuromuscular differentiation is grossly defective in these mice.

[38940] It is appreciated that the abovementioned animal model for AGRN is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[38941] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[38942] Rupp, F.; Payan, D. G.; Magill-Solc, C.; Cowan, D. M.; Scheller, R. H. : Structure and expression of a rat agrin. Neuron 6: 811-823, 1991. ; and

[38943] Gautam, M.; Noakes, P. G.; Moscoso, L.; Rupp, F.; Scheller, R. H.; Merlie, J. P.; Sanes, J. R. : Defective neuromuscular synaptogenesis in agrin-deficient mutant mice. Cell 85: 525-535.

[38944] Further studies establishing the function and utilities of AGRN are found in John Hopkins OMIM database record ID 103320, and in cited publications numbered 11875-1187

and 12115–12121 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Ankyrin 1, Erythrocytic (ANK1, Accession XM_016774) is another VGAM1063 host target gene. ANK1 BINDING SITE1 through ANK1 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ANK1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ANK1 BINDING SITE1 through ANK1 BINDING SITE3, designated SEQ ID:30280, SEQ ID:21729 and SEQ ID:5476 respectively, to the nucleotide sequence of VGAM1063 RNA, herein designated VGAM RNA, also designated SEQ ID:3774.

[38945] Another function of VGAM1063 is therefore inhibition of Ankyrin 1, Erythrocytic (ANK1, Accession XM_016774). Accordingly, utilities of VGAM1063 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ANK1. E74-like Factor 3 (ets domain transcription factor, epithelial-specific) (ELF3, Accession NM_004433) is another VGAM1063 host target gene. ELF3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ELF3, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ELF3 BINDING SITE, designated SEQ ID:10719, to the nucleotide sequence of VGAM1063 RNA, herein designated VGAM RNA, also designated SEQ ID:3774.

[38946] Another function of VGAM1063 is therefore inhibition of E74-like Factor 3 (ets domain transcription factor, epithelial-specific) (ELF3, Accession NM_004433), a gene which is a transcription factor known to be exclusively expressed in epithelial cells. Accordingly, utilities of VGAM1063 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ELF3. The function of ELF3 has been established by previous studies. Oettgen et al. (1997) isolated and characterized a novel member of the ETS transcription factor family (see OMIM Ref. No. 164720), which they called ESX (also known as ESS-E). This was the first ETS factor and one of only a few transcription factors known to be exclusively expressed in epithelial cells. ESX contains 2 putative DNA-binding domains: an ETS domain and an A/T hook domain. Oettgen et al. (1999) determined that the ELF3 gene contains 9 exons spanning approximately 5.8 kb of ge-

omic DNA. By fluorescence in situ hybridization (FISH), Oettgen et al. (1997) mapped the ESX gene to 1q32. By the same method, Tymms et al. (1997) refined the location to 1q32.2.

[38947] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[38948] Oettgen, P.; Alani, R. M.; Barcinski, M. A.; Brown, L.; Akbarali, Y.; Boltax, J.; Kunsch, C.; Munger, K.; Liebermann, T. A. : Isolation and characterization of a novel epithelium-specific transcription factor, ESE-1, a member of the Ets family. *Molec. Cell. Biol.* 17: 4419-4433, 1997. ; and

[38949] Oettgen, P.; Barcinski, M.; Boltax, J.; Stolt, P.; Akbarali, Y.; Liebermann, T. A. : Genomic organization of the human ELF3 (ESE-1/ESX) gene, a member of the Ets transcription factor fami.

[38950] Further studies establishing the function and utilities of ELF3 are found in John Hopkins OMIM database record ID 602191, and in cited publications numbered 5847-584 and 5851 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Fibronectin 1 (FN1, Accession NM_002026) is another VGAM1063 host target gene. FN1 BINDING SITE1

and FN1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FN1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FN1 BINDING SITE1 and FN1 BINDING SITE2, designated SEQ ID:7778 and SEQ ID:27644 respectively, to the nucleotide sequence of VGAM1063 RNA, herein designated VGAM RNA, also designated SEQ ID:3774.

[38951] Another function of VGAM1063 is therefore inhibition of Fibronectin 1 (FN1, Accession NM_002026), a gene which binds cell surfaces and various compounds including collagen, fibrin, heparin, dna, and actin. Accordingly, utilities of VGAM1063 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FN1. The function of FN1 has been established by previous studies. Fibronectin deficiency has been identified in association with a form of the Ehlers–Danlos syndrome (OMIM Ref. No. type X); see 225310. Is the mutation in that disorder at the locus referred to here? Shirakami et al. (1986) reported plasma fibronectin deficiency in 8 members of 1 family. Enzyme levels were about half–normal in the deficient persons, who were distributed in 3 genera–

tions and 4 sibships in a regular autosomal dominant pattern with male-to-male transmission. The proband, a 31-year-old woman, had keloids at sites of surgery and burns but no other abnormalities; no keloids were found in the deficient relatives. Specifically, there was no unusual susceptibility to infections, bleeding diathesis, or hyperextensibility of joints or skin (see OMIM Ref. No. 225310). No homozygote was definitely demonstrated; a possible homozygote with first-cousin parents died soon after birth. Animal model experiments lend further support to the function of FN1. To investigate the role of plasma fibronectin in vivo, Sakai et al. (2001) generated plasma fibronectin-deficient adult mice using Cre-loxP conditional gene-knockout technology. Sakai et al. (2001) demonstrated that plasma fibronectin-deficient mice show increased neuronal apoptosis and larger infarction areas following transient focal cerebral ischemia. Surprisingly, plasma fibronectin is not essential for skin-wound healing or hemostasis.

[38952] It is appreciated that the abovementioned animal model for FN1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[38953] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[38954] Sakai, T.; Johnson, K. J.; Murozono, M.; Sakai, K.; Magnusson, M. A.; Wieloch, T.; Cronberg, T.; Isshiki, A.; Erickson, H. P.; Fassler, R. : Plasma fibronectin supports neuronal survival and reduces brain injury following transient focal cerebral ischemia but is not essential for skin-wound healing and hemostasis. *Nature Med.* 7: 324–330, 2001. ; and

[38955] Shirakami, A.; Shigekiyo, T.; Hirai, Y.; Takeichi, T.; Kawauchi, S.; Saito, S.; Miyoshi, K. : Plasma fibronectin deficiency in eight members of one family. *Lancet I*: 473–474, 1986.

[38956] Further studies establishing the function and utilities of FN1 are found in John Hopkins OMIM database record ID 135600, and in cited publications numbered 2153–2176, 878, 3324–333 and 12153 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Heparan Sulfate 2–O–sulfotransferase 1 (HS2ST1, Accession NM_012262) is another VGAM1063 host target gene. HS2ST1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA

encoded by HS2ST1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HS2ST1 BINDING SITE, designated SEQ ID:14574, to the nucleotide sequence of VGAM1063 RNA, herein designated VGAM RNA, also designated SEQ ID:3774.

[38957] Another function of VGAM1063 is therefore inhibition of Heparan Sulfate 2-O-sulfotransferase 1 (HS2ST1, Accession NM_012262). Accordingly, utilities of VGAM1063 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HS2ST1. Integrin, Alpha 3 (antigen CD49C, alpha 3 subunit of VLA-3 receptor) (ITGA3, Accession NM_005501) is another VGAM1063 host target gene. ITGA3 BINDING SITE1 and ITGA3 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ITGA3, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITGA3 BINDING SITE1 and ITGA3 BINDING SITE2, designated SEQ ID:12008 and SEQ ID:7965 respectively, to the nucleotide sequence of VGAM1063 RNA, herein design-

nated VGAM RNA, also designated SEQ ID:3774.

[38958] Another function of VGAM1063 is therefore inhibition of Integrin, Alpha 3 (antigen CD49C, alpha 3 subunit of VLA-3 receptor) (ITGA3, Accession NM_005501), a gene which is a receptor for fibronectin, laminin, collagen, epiligrin and thrombospondin. Accordingly, utilities of VGAM1063 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITGA3. The function of ITGA3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1020. Polymerase (RNA) II (DNA directed) Polypeptide E, 25kDa (POLR2E, Accession XM_009279) is another VGAM1063 host target gene. POLR2E BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by POLR2E, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of POLR2E BINDING SITE, designated SEQ ID:30107, to the nucleotide sequence of VGAM1063 RNA, herein designated VGAM RNA, also designated SEQ ID:3774.

[38959] Another function of VGAM1063 is therefore inhibition of

Polymerase (RNA) II (DNA directed) Polypeptide E, 25kDa (POLR2E, Accession XM_009279), a gene which is a subunit of a DNA-dependent RNA polymerase. Accordingly, utilities of VGAM1063 include diagnosis, prevention and treatment of diseases and clinical conditions associated with POLR2E. The function of POLR2E has been established by previous studies. Acker et al. (1994) isolated cDNAs of 5 subunits of RNA polymerase II. Cramer et al. (2000) derived a backbone model of a 10-subunit yeast RNA polymerase II using x-ray diffraction data extending to 3-angstrom resolution. All 10 subunits exhibited a high degree of identity with the corresponding human proteins, and 9 of the 10 subunits are conserved among the 3 eukaryotic RNA polymerases I, II, and III. Notable features of the model include a pair of jaws, formed by subunits Rpb1 (OMIM Ref. No. 180660), Rpb5 (homologous to human POLR2E), and Rpb9 (OMIM Ref. No. 180662), that appear to grip DNA downstream of the active center. A clamp on the DNA nearer the active center, formed by Rpb1, Rpb2 (OMIM Ref. No. 180661), and Rpb6 (OMIM Ref. No. 604414), may be locked in the closed position by RNA, accounting for the great stability of transcribing complexes. A pore in the protein complex be-

neath the active center may allow entry of substrates for polymerization and exit of the transcript during proof-reading and passage through pause sites in the DNA.

[38960] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[38961] Acker, J.; Mattei, M.-G.; Wintzerith, M.; Roeckel, N.; Depetris, D.; Vigneron, M.; Kedinger, C. : Chromosomal localization of human RNA polymerase II subunit genes. *Genomics* 20: 496-499, 1994. ; and

[38962] Cramer, P.; Bushnell, D. A.; Fu, J.; Gnatt, A. L.; Maier-Davis, B.; Thompson, N. E.; Burgess, R. R.; Edwards, A. M.; David, P. R.; Kornberg, R. D. : Architecture of RNA polymerase II and im.

[38963] Further studies establishing the function and utilities of POLR2E are found in John Hopkins OMIM database record ID 180664, and in cited publications numbered 12398 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Ribonuclease, RNase A Family, 1 (pancreatic) (RNASE1, Accession NM_002933) is another VGAM1063 host target gene. RNASE1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by

RNASE1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNASE1 BINDING SITE, designated SEQ ID:8835, to the nucleotide sequence of VGAM1063 RNA, herein designated VGAM RNA, also designated SEQ ID:3774.

[38964] Another function of VGAM1063 is therefore inhibition of Ribonuclease, RNase A Family, 1 (pancreatic) (RNASE1, Accession NM_002933), a gene which is a Pancreatic ribonuclease; a pyrimidine-specific endonuclease that generates 2',3'-cyclic phosphate products. Accordingly, utilities of VGAM1063 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNASE1. The function of RNASE1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM210.SH3-domain GRB2-like 1 (SH3GL1, Accession NM_003025) is another VGAM1063 host target gene. SH3GL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SH3GL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of SH3GL1 BINDING SITE, designated SEQ ID:8961, to the nucleotide sequence of VGAM1063 RNA, herein designated VGAM RNA, also designated SEQ ID:3774.

[38965] Another function of VGAM1063 is therefore inhibition of SH3-domain GRB2-like 1 (SH3GL1, Accession NM_003025). Accordingly, utilities of VGAM1063 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SH3GL1. SH3 and Multiple Ankyrin Repeat Domains 2 (SHANK2, Accession NM_133266) is another VGAM1063 host target gene. SHANK2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SHANK2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SHANK2 BINDING SITE, designated SEQ ID:28421, to the nucleotide sequence of VGAM1063 RNA, herein designated VGAM RNA, also designated SEQ ID:3774.

[38966] Another function of VGAM1063 is therefore inhibition of SH3 and Multiple Ankyrin Repeat Domains 2 (SHANK2, Ac-

cession NM_133266). Accordingly, utilities of VGAM1063 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SHANK2. Solute Carrier Family 4, Anion Exchanger, Member 1 (erythrocyte membrane protein band 3, Diego blood group) (SLC4A1, Accession NM_000342) is another VGAM1063 host target gene. SLC4A1 BINDING SITE1 and SLC4A1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by SLC4A1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC4A1 BINDING SITE1 and SLC4A1 BINDING SITE2, designated SEQ ID:5893 and SEQ ID:5894 respectively, to the nucleotide sequence of VGAM1063 RNA, herein designated VGAM RNA, also designated SEQ ID:3774.

[38967] Another function of VGAM1063 is therefore inhibition of Solute Carrier Family 4, Anion Exchanger, Member 1 (erythrocyte membrane protein band 3, Diego blood group) (SLC4A1, Accession NM_000342). Accordingly, utilities of VGAM1063 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC4A1. SORCS2 (Accession NM_020777) is another

VGAM1063 host target gene. SORCS2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SORCS2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SORCS2 BINDING SITE, designated SEQ ID:21875, to the nucleotide sequence of VGAM1063 RNA, herein designated VGAM RNA, also designated SEQ ID:3774.

[38968] Another function of VGAM1063 is therefore inhibition of SORCS2 (Accession NM_020777). Accordingly, utilities of VGAM1063 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SORCS2. SORCS3 (Accession NM_014978) is another VGAM1063 host target gene. SORCS3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SORCS3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SORCS3 BINDING SITE, designated SEQ ID:17363, to the nucleotide sequence of VGAM1063 RNA, herein designated VGAM RNA, also designated SEQ ID:3774.

[38969] Another function of VGAM1063 is therefore inhibition of SORCS3 (Accession NM_014978). Accordingly, utilities of VGAM1063 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SORCS3. Suppression of Tumorigenicity 7 (ST7, Accession NM_021908) is another VGAM1063 host target gene. ST7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ST7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ST7 BINDING SITE, designated SEQ ID:22429, to the nucleotide sequence of VGAM1063 RNA, herein designated VGAM RNA, also designated SEQ ID:3774.

[38970] Another function of VGAM1063 is therefore inhibition of Suppression of Tumorigenicity 7 (ST7, Accession NM_021908), a gene which has a role in regulating cell-environment or cell-cell interactions. Accordingly, utilities of VGAM1063 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ST7. The function of ST7 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference

to VGAM107.APELIN (Accession NM_017413) is another VGAM1063 host target gene. APELIN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by APELIN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of APELIN BINDING SITE, designated SEQ ID:18871, to the nucleotide sequence of VGAM1063 RNA, herein designated VGAM RNA, also designated SEQ ID:3774.

[38971] Another function of VGAM1063 is therefore inhibition of APELIN (Accession NM_017413). Accordingly, utilities of VGAM1063 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APELIN. Chromosome 5 Open Reading Frame 6 (C5orf6, Accession NM_016605) is another VGAM1063 host target gene. C5orf6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C5orf6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C5orf6 BINDING SITE, designated SEQ ID:18701, to the nucleotide sequence of VGAM1063 RNA,

herein designated VGAM RNA, also designated SEQ ID:3774.

[38972] Another function of VGAM1063 is therefore inhibition of Chromosome 5 Open Reading Frame 6 (C5orf6, Accession NM_016605). Accordingly, utilities of VGAM1063 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C5orf6. DJ37E16.5 (Accession NM_020315) is another VGAM1063 host target gene. DJ37E16.5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DJ37E16.5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DJ37E16.5 BINDING SITE, designated SEQ ID:21575, to the nucleotide sequence of VGAM1063 RNA, herein designated VGAM RNA, also designated SEQ ID:3774.

[38973] Another function of VGAM1063 is therefore inhibition of DJ37E16.5 (Accession NM_020315). Accordingly, utilities of VGAM1063 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DJ37E16.5. DKFZP434L1435 (Accession XM_166401) is another VGAM1063 host target gene. DKFZP434L1435

BINDING SITE1 through DKFZP434L1435 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by DKFZP434L1435, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434L1435 BINDING SITE1 through DKFZP434L1435 BINDING SITE3, designated SEQ ID:44267, SEQ ID:46664 and SEQ ID:46702 respectively, to the nucleotide sequence of VGAM1063 RNA, herein designated VGAM RNA, also designated SEQ ID:3774.

[38974] Another function of VGAM1063 is therefore inhibition of DKFZP434L1435 (Accession XM_166401). Accordingly, utilities of VGAM1063 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434L1435. FLJ10074 (Accession NM_017988) is another VGAM1063 host target gene. FLJ10074 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ10074, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10074 BINDING SITE, designated SEQ ID:19719, to the

nucleotide sequence of VGAM1063 RNA, herein designated VGAM RNA, also designated SEQ ID:3774.

[38975] Another function of VGAM1063 is therefore inhibition of FLJ10074 (Accession NM_017988). Accordingly, utilities of VGAM1063 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10074. FLJ13204 (Accession NM_024761) is another VGAM1063 host target gene. FLJ13204 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13204, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13204 BINDING SITE, designated SEQ ID:24116, to the nucleotide sequence of VGAM1063 RNA, herein designated VGAM RNA, also designated SEQ ID:3774.

[38976] Another function of VGAM1063 is therefore inhibition of FLJ13204 (Accession NM_024761). Accordingly, utilities of VGAM1063 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13204. FLJ22671 (Accession NM_024861) is another VGAM1063 host target gene. FLJ22671 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by FLJ22671, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22671 BINDING SITE, designated SEQ ID:24294, to the nucleotide sequence of VGAM1063 RNA, herein designated VGAM RNA, also designated SEQ ID:3774.

[38977] Another function of VGAM1063 is therefore inhibition of FLJ22671 (Accession NM_024861). Accordingly, utilities of VGAM1063 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22671. Glycoprotein V (platelet) (GP5, Accession NM_004488) is another VGAM1063 host target gene. GP5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GP5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GP5 BINDING SITE, designated SEQ ID:10817, to the nucleotide sequence of VGAM1063 RNA, herein designated VGAM RNA, also designated SEQ ID:3774.

[38978] Another function of VGAM1063 is therefore inhibition of Glycoprotein V (platelet) (GP5, Accession NM_004488).

Accordingly, utilities of VGAM1063 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GP5. KIAA0296 (Accession NM_014699) is another VGAM1063 host target gene. KIAA0296 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0296, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0296 BINDING SITE, designated SEQ ID:16220, to the nucleotide sequence of VGAM1063 RNA, herein designated VGAM RNA, also designated SEQ ID:3774.

[38979] Another function of VGAM1063 is therefore inhibition of KIAA0296 (Accession NM_014699). Accordingly, utilities of VGAM1063 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0296. KIAA0429 (Accession NM_014751) is another VGAM1063 host target gene. KIAA0429 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0429, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA0429 BINDING SITE, designated SEQ ID:16469, to the nucleotide sequence of VGAM1063 RNA, herein designated VGAM RNA, also designated SEQ ID:3774.

[38980] Another function of VGAM1063 is therefore inhibition of KIAA0429 (Accession NM_014751). Accordingly, utilities of VGAM1063 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0429. KIAA1193 (Accession XM_041843) is another VGAM1063 host target gene. KIAA1193 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1193, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1193 BINDING SITE, designated SEQ ID:33580, to the nucleotide sequence of VGAM1063 RNA, herein designated VGAM RNA, also designated SEQ ID:3774.

[38981] Another function of VGAM1063 is therefore inhibition of KIAA1193 (Accession XM_041843). Accordingly, utilities of VGAM1063 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1193. KIAA1322 (Accession XM_052626) is another

VGAM1063 host target gene. KIAA1322 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1322, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1322 BINDING SITE, designated SEQ ID:36024, to the nucleotide sequence of VGAM1063 RNA, herein designated VGAM RNA, also designated SEQ ID:3774.

[38982] Another function of VGAM1063 is therefore inhibition of KIAA1322 (Accession XM_052626). Accordingly, utilities of VGAM1063 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1322. KIAA1813 (Accession XM_046743) is another VGAM1063 host target gene. KIAA1813 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1813, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1813 BINDING SITE, designated SEQ ID:34810, to the nucleotide sequence of VGAM1063 RNA, herein designated VGAM RNA, also designated SEQ ID:3774.

[38983] Another function of VGAM1063 is therefore inhibition of KIAA1813 (Accession XM_046743). Accordingly, utilities of VGAM1063 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1813. MGC19556 (Accession NM_033551) is another VGAM1063 host target gene. MGC19556 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC19556, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC19556 BINDING SITE, designated SEQ ID:27316, to the nucleotide sequence of VGAM1063 RNA, herein designated VGAM RNA, also designated SEQ ID:3774.

[38984] Another function of VGAM1063 is therefore inhibition of MGC19556 (Accession NM_033551). Accordingly, utilities of VGAM1063 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC19556. MGC2780 (Accession NM_025266) is another VGAM1063 host target gene. MGC2780 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC2780, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC2780 BINDING SITE, designated SEQ ID:24934, to the nucleotide sequence of VGAM1063 RNA, herein designated VGAM RNA, also designated SEQ ID:3774.

[38985] Another function of VGAM1063 is therefore inhibition of MGC2780 (Accession NM_025266). Accordingly, utilities of VGAM1063 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2780. Phosphatase, Orphan 1 (phospho1, Accession XM_091572) is another VGAM1063 host target gene. phospho1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by phospho1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of phospho1 BINDING SITE, designated SEQ ID:40061, to the nucleotide sequence of VGAM1063 RNA, herein designated VGAM RNA, also designated SEQ ID:3774.

[38986] Another function of VGAM1063 is therefore inhibition of Phosphatase, Orphan 1 (phospho1, Accession XM_091572). Accordingly, utilities of VGAM1063 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with phospho1. SNRK (Accession NM_017719) is another VGAM1063 host target gene.

SNRK BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SNRK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SNRK BINDING SITE, designated SEQ ID:19309, to the nucleotide sequence of VGAM1063 RNA, herein designated VGAM RNA, also designated SEQ ID:3774.

[38987] Another function of VGAM1063 is therefore inhibition of SNRK (Accession NM_017719). Accordingly, utilities of VGAM1063 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNRK. Torsin Family 2, Member A (TOR2A, Accession NM_130459) is another VGAM1063 host target gene. TOR2A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TOR2A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TOR2A BINDING SITE, designated SEQ

ID:28218, to the nucleotide sequence of VGAM1063 RNA, herein designated VGAM RNA, also designated SEQ ID:3774.

[38988] Another function of VGAM1063 is therefore inhibition of Torsin Family 2, Member A (TOR2A, Accession NM_130459). Accordingly, utilities of VGAM1063 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TOR2A. Tumor Protein P53 Inducible Nuclear Protein 1 (TP53INP1, Accession NM_033285) is another VGAM1063 host target gene. TP53INP1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by TP53INP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TP53INP1 BINDING SITE, designated SEQ ID:27106, to the nucleotide sequence of VGAM1063 RNA, herein designated VGAM RNA, also designated SEQ ID:3774.

[38989] Another function of VGAM1063 is therefore inhibition of Tumor Protein P53 Inducible Nuclear Protein 1 (TP53INP1, Accession NM_033285). Accordingly, utilities of VGAM1063 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with TP53INP1. Zinc Finger Protein 304 (ZNF304, Accession NM_020657) is another VGAM1063 host target gene. ZNF304 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF304, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF304 BINDING SITE, designated SEQ ID:21829, to the nucleotide sequence of VGAM1063 RNA, herein designated VGAM RNA, also designated SEQ ID:3774.

[38990] Another function of VGAM1063 is therefore inhibition of Zinc Finger Protein 304 (ZNF304, Accession NM_020657). Accordingly, utilities of VGAM1063 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF304. LOC146733 (Accession XM_097076) is another VGAM1063 host target gene. LOC146733 BINDING SITE1 and LOC146733 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LOC146733, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of LOC146733 BINDING SITE1 and LOC146733 BINDING SITE2, designated SEQ ID:40727 and SEQ ID:40728 respectively, to the nucleotide sequence of VGAM1063 RNA, herein designated VGAM RNA, also designated SEQ ID:3774.

[38991] Another function of VGAM1063 is therefore inhibition of LOC146733 (Accession XM_097076). Accordingly, utilities of VGAM1063 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146733. LOC157931 (Accession XM_098845) is another VGAM1063 host target gene. LOC157931 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC157931, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157931 BINDING SITE, designated SEQ ID:41902, to the nucleotide sequence of VGAM1063 RNA, herein designated VGAM RNA, also designated SEQ ID:3774.

[38992] Another function of VGAM1063 is therefore inhibition of LOC157931 (Accession XM_098845). Accordingly, utilities of VGAM1063 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC157931. LOC166341 (Accession XM_093804) is another VGAM1063 host target gene. LOC166341 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC166341, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC166341 BINDING SITE, designated SEQ ID:40212, to the nucleotide sequence of VGAM1063 RNA, herein designated VGAM RNA, also designated SEQ ID:3774.

[38993] Another function of VGAM1063 is therefore inhibition of LOC166341 (Accession XM_093804). Accordingly, utilities of VGAM1063 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC166341. LOC220020 (Accession XM_167821) is another VGAM1063 host target gene. LOC220020 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC220020, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220020 BINDING SITE, designated SEQ ID:44863, to

the nucleotide sequence of VGAM1063 RNA, herein designated VGAM RNA, also designated SEQ ID:3774.

[38994] Another function of VGAM1063 is therefore inhibition of LOC220020 (Accession XM_167821). Accordingly, utilities of VGAM1063 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220020. LOC222070 (Accession XM_168433) is another VGAM1063 host target gene. LOC222070 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC222070, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222070 BINDING SITE, designated SEQ ID:45178, to the nucleotide sequence of VGAM1063 RNA, herein designated VGAM RNA, also designated SEQ ID:3774.

[38995] Another function of VGAM1063 is therefore inhibition of LOC222070 (Accession XM_168433). Accordingly, utilities of VGAM1063 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222070. LOC257490 (Accession XM_175163) is another VGAM1063 host target gene. LOC257490 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by LOC257490, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257490 BINDING SITE, designated SEQ ID:46647, to the nucleotide sequence of VGAM1063 RNA, herein designated VGAM RNA, also designated SEQ ID:3774.

[38996] Another function of VGAM1063 is therefore inhibition of LOC257490 (Accession XM_175163). Accordingly, utilities of VGAM1063 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257490. LOC90784 (Accession XM_034109) is another VGAM1063 host target gene. LOC90784 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC90784, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90784 BINDING SITE, designated SEQ ID:32004, to the nucleotide sequence of VGAM1063 RNA, herein designated VGAM RNA, also designated SEQ ID:3774.

[38997] Another function of VGAM1063 is therefore inhibition of LOC90784 (Accession XM_034109). Accordingly, utilities

of VGAM1063 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90784. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1064 (VGAM1064) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[38998] VGAM1064 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1064 was detected is described hereinabove with reference to Figs. 1-8.

[38999] VGAM1064 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tulip Virus X. VGAM1064 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[39000] VGAM1064 gene encodes a VGAM1064 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1064 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nu-

cleotide sequence of VGAM1064 precursor RNA is designated SEQ ID:1050, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1050 is located at position 3436 relative to the genome of Tulip Virus X.

- [39001] VGAM1064 precursor RNA folds onto itself, forming VGAM1064 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [39002] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1064 folded precursor RNA into VGAM1064 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM1064 RNA is designated SEQ ID:3775, and

is provided hereinbelow with reference to the sequence listing part.

[39003] VGAM1064 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1064 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1064 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[39004] VGAM1064 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1064 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1064 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing – VGAM1064 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1064 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[39005] The complementary binding of VGAM1064 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1064 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1064 host target RNA into VGAM1064 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[39006] It is appreciated that VGAM1064 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1064 host target genes. The mRNA of each one of this plurality of VGAM1064 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com–

plementary to VGAM1064 RNA, herein designated VGAM RNA, and which when bound by VGAM1064 RNA causes inhibition of translation of respective one or more VGAM1064 host target proteins.

[39007] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1064 gene, herein designated VGAM GENE, on one or more VGAM1064 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[39008] It is yet further appreciated that a function of VGAM1064 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1064 include diagnosis, prevention and treatment of viral infection by Tulip Virus X. Specific functions, and accordingly utilities, of VGAM1064 correlate with, and may be deduced from, the identity of the host target genes which VGAM1064 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[39009] Nucleotide sequences of the VGAM1064 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1064 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1064 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1064 are further described hereinbelow with reference to Table 1.

[39010] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1064 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1064 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[39011] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM1064 gene, herein designated VGAM is inhibition of expression of VGAM1064 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1064 correlate with, and may be deduced from, the identity of the target genes which VGAM1064 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[39012] UDP-Gal:betaGlcNAc Beta 1,4- Galactosyltransferase, Polypeptide 5 (B4GALT5, Accession NM_004776) is a VGAM1064 host target gene. B4GALT5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by B4GALT5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of B4GALT5 BINDING SITE, designated SEQ ID:11165, to the nucleotide sequence of VGAM1064 RNA, herein designated VGAM RNA, also designated SEQ ID:3775.

[39013] A function of VGAM1064 is therefore inhibition of UDP-Gal:betaGlcNAc Beta 1,4- Galactosyltransferase, Polypeptide 5 (B4GALT5, Accession NM_004776). Accordingly, utilities of VGAM1064 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with B4GALT5. NIMA (never in mitosis gene a)-related Kinase 6 (NEK6, Accession NM_014397) is another VGAM1064 host target gene. NEK6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NEK6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NEK6 BINDING SITE, designated SEQ ID:15739, to the nucleotide sequence of VGAM1064 RNA, herein designated VGAM RNA, also designated SEQ ID:3775.

[39014] Another function of VGAM1064 is therefore inhibition of NIMA (never in mitosis gene a)-related Kinase 6 (NEK6, Accession NM_014397), a gene which regulates nuclear and cytoplasmic aspects of the mitotic cycle. Accordingly, utilities of VGAM1064 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NEK6. The function of NEK6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM426.FLJ13397 (Accession NM_024948) is another VGAM1064 host target gene. FLJ13397 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by FLJ13397, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13397 BINDING SITE, designated SEQ ID:24502, to the nucleotide sequence of VGAM1064 RNA, herein designated VGAM RNA, also designated SEQ ID:3775.

[39015] Another function of VGAM1064 is therefore inhibition of FLJ13397 (Accession NM_024948). Accordingly, utilities of VGAM1064 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13397. KIAA0993 (Accession XM_034413) is another VGAM1064 host target gene. KIAA0993 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0993, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0993 BINDING SITE, designated SEQ ID:32077, to the nucleotide sequence of VGAM1064 RNA, herein designated VGAM RNA, also designated SEQ ID:3775.

[39016] Another function of VGAM1064 is therefore inhibition of KIAA0993 (Accession XM_034413). Accordingly, utilities

of VGAM1064 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0993. Neuron Navigator 3 (NAV3, Accession NM_014903) is another VGAM1064 host target gene. NAV3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NAV3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NAV3 BINDING SITE, designated SEQ ID:17089, to the nucleotide sequence of VGAM1064 RNA, herein designated VGAM RNA, also designated SEQ ID:3775.

[39017] Another function of VGAM1064 is therefore inhibition of Neuron Navigator 3 (NAV3, Accession NM_014903). Accordingly, utilities of VGAM1064 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NAV3. Signal Transducing Adaptor Molecule (SH3 domain and ITAM motif) 2 (STAM2, Accession NM_005843) is another VGAM1064 host target gene. STAM2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by STAM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of STAM2 BINDING SITE, designated SEQ ID:12457, to the nucleotide sequence of VGAM1064 RNA, herein designated VGAM RNA, also designated SEQ ID:3775.

[39018] Another function of VGAM1064 is therefore inhibition of Signal Transducing Adaptor Molecule (SH3 domain and ITAM motif) 2 (STAM2, Accession NM_005843). Accordingly, utilities of VGAM1064 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STAM2. LOC146452 (Accession XM_085473) is another VGAM1064 host target gene. LOC146452 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146452, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146452 BINDING SITE, designated SEQ ID:38163, to the nucleotide sequence of VGAM1064 RNA, herein designated VGAM RNA, also designated SEQ ID:3775.

[39019] Another function of VGAM1064 is therefore inhibition of LOC146452 (Accession XM_085473). Accordingly, utilities of VGAM1064 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC146452. LOC149153 (Accession XM_097599) is another VGAM1064 host target gene. LOC149153 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC149153, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149153 BINDING SITE, designated SEQ ID:40963, to the nucleotide sequence of VGAM1064 RNA, herein designated VGAM RNA, also designated SEQ ID:3775.

[39020] Another function of VGAM1064 is therefore inhibition of LOC149153 (Accession XM_097599). Accordingly, utilities of VGAM1064 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149153. LOC90750 (Accession XM_033868) is another VGAM1064 host target gene. LOC90750 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC90750, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90750 BINDING SITE, designated SEQ ID:31964, to the

nucleotide sequence of VGAM1064 RNA, herein designated VGAM RNA, also designated SEQ ID:3775.

[39021] Another function of VGAM1064 is therefore inhibition of LOC90750 (Accession XM_033868). Accordingly, utilities of VGAM1064 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90750. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1065 (VGAM1065) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[39022] VGAM1065 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1065 was detected is described hereinabove with reference to Figs. 1–8.

[39023] VGAM1065 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tulip Virus X.

VGAM1065 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[39024] VGAM1065 gene encodes a VGAM1065 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1065 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1065 precursor RNA is designated SEQ ID:1051, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1051 is located at position 1206 relative to the genome of Tulip Virus X.

[39025] VGAM1065 precursor RNA folds onto itself, forming VGAM1065 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[39026] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1065 folded precursor RNA into VGAM1065 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 48%) nucleotide sequence of VGAM1065 RNA is designated SEQ ID:3776, and is provided hereinbelow with reference to the sequence listing part.

[39027] VGAM1065 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1065 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1065 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[39028] VGAM1065 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1065 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1065 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1065 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1065 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[39029] The complementary binding of VGAM1065 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1065 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1065 host target RNA into VGAM1065 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[39030] It is appreciated that VGAM1065 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM1065 host target genes. The mRNA of each one of this plurality of VGAM1065 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1065 RNA, herein designated VGAM RNA, and which when bound by VGAM1065 RNA causes inhibition of translation of respective one or more VGAM1065 host target proteins.

[39031] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1065 gene, herein designated VGAM GENE, on one or more VGAM1065 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science
294,779 (2001)).

[39032] It is yet further appreciated that a function of VGAM1065 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1065 include diagnosis, prevention and treatment of viral infection by Tulip Virus X. Specific functions, and accordingly utilities, of VGAM1065 correlate with, and may be deduced from, the identity of the host target genes which VGAM1065 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[39033] Nucleotide sequences of the VGAM1065 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1065 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1065 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1065 are further described hereinbelow with reference to Table 1.

[39034] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1065 host target RNA, and schematic representation of the complementarity of each

of these host target binding sites to VGAM1065 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[39035] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1065 gene, herein designated VGAM is inhibition of expression of VGAM1065 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1065 correlate with, and may be deduced from, the identity of the target genes which VGAM1065 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[39036] Citron (rho-interacting, serine/threonine kinase 21) (CIT, Accession XM_045786) is a VGAM1065 host target gene. CIT BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CIT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CIT BINDING SITE, designated SEQ ID:34560, to the nucleotide sequence of VGAM1065 RNA, herein designated VGAM RNA, also designated SEQ ID:3776.

[39037] A function of VGAM1065 is therefore inhibition of Citron (rho-interacting, serine/threonine kinase 21) (CIT, Acces-

sion XM_045786), a gene which is increased several-fold by coexpression of constitutively active Rho . Accordingly, utilities of VGAM1065 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CIT. The function of CIT and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM393. Eukaryotic Translation Initiation Factor 4 Gamma, 2 (EIF4G2, Accession NM_001418) is another VGAM1065 host target gene. EIF4G2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EIF4G2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EIF4G2 BINDING SITE, designated SEQ ID:7115, to the nucleotide sequence of VGAM1065 RNA, herein designated VGAM RNA, also designated SEQ ID:3776.

[39038] Another function of VGAM1065 is therefore inhibition of Eukaryotic Translation Initiation Factor 4 Gamma, 2 (EIF4G2, Accession NM_001418), a gene which is a repressor of translation. Accordingly, utilities of VGAM1065 include diagnosis, prevention and treatment of diseases

and clinical conditions associated with EIF4G2. The function of EIF4G2 has been established by previous studies. Imataka et al. (1997) used immunoprecipitation studies with HA- or FLAG-tagged proteins to show that p97 specifically binds to EIF4A and EIF3, but not to EIF4E (OMIM Ref. No. 133440) in vitro. Transient transfection experiments showed that p97 suppressed both cap-dependent and independent translation, and that overexpression of p97 reduced overall protein synthesis. Imataka et al. (1997) suggested that p97 is a general repressor of translation that acts by forming translationally inactive complexes. Levy-Strumpf et al. (1997) showed that while a fragment of DAP5 cDNA from the C-terminal region (encoding a 28-kD 'miniprotein') protected cells from IFNG-induced programmed cell death at low levels of expression, higher levels of expression were toxic. They proposed that the miniprotein may be a dominant-negative inhibitor of the essential DAP5 protein, and that DAP5 may play a specific role in apoptosis.

[39039] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[39040] Imataka, H.; Olsen, H. S.; Sonenberg. N. : A new transla-

tional regulator with homology to eukaryotic translation initiation factor 4G. EMBO J. 16: 817–825, 1997. ; and

[39041] Levy–Strumpf, N.; Deiss, L. P.; Berissi, H.; Kimchi, A. : DAP–5, a novel homolog of eukaryotic translation initiation factor 4G isolated as a putative modulator of gamma interferon–indu.

[39042] Further studies establishing the function and utilities of EIF4G2 are found in John Hopkins OMIM database record ID 602325, and in cited publications numbered 6302–6303, 346 and 6304–6305 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Nuclear Receptor Coactivator 4 (NCOA4, Accession NM_005437) is another VGAM1065 host target gene. NCOA4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NCOA4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NCOA4 BINDING SITE, designated SEQ ID:11923, to the nucleotide sequence of VGAM1065 RNA, herein designated VGAM RNA, also designated SEQ ID:3776.

[39043] Another function of VGAM1065 is therefore inhibition of

Nuclear Receptor Coactivator 4 (NCOA4, Accession NM_005437), a gene which Binds and activates androgen receptor (AR) in ligand-dependent manner. Accordingly, utilities of VGAM1065 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NCOA4. The function of NCOA4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM420.FLJ11850 (Accession NM_022741) is another VGAM1065 host target gene. FLJ11850 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ11850, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11850 BINDING SITE, designated SEQ ID:22948, to the nucleotide sequence of VGAM1065 RNA, herein designated VGAM RNA, also designated SEQ ID:3776.

[39044] Another function of VGAM1065 is therefore inhibition of FLJ11850 (Accession NM_022741). Accordingly, utilities of VGAM1065 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

FLJ11850. Golgi Autoantigen, Golgin Subfamily A, 1 (GOLGA1, Accession NM_002077) is another VGAM1065 host target gene. GOLGA1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GOLGA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GOLGA1 BINDING SITE, designated SEQ ID:7859, to the nucleotide sequence of VGAM1065 RNA, herein designated VGAM RNA, also designated SEQ ID:3776.

[39045] Another function of VGAM1065 is therefore inhibition of Golgi Autoantigen, Golgin Subfamily A, 1 (GOLGA1, Accession NM_002077). Accordingly, utilities of VGAM1065 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GOLGA1. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1066 (VGAM1066) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[39046] VGAM1066 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1066 was detected is described hereinabove with reference to Figs. 1–8.

[39047] VGAM1066 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tulip Virus X.

VGAM1066 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[39048] VGAM1066 gene encodes a VGAM1066 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1066 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1066 precursor RNA is designated SEQ ID:1052, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1052 is located at position 2880 relative to the genome of Tulip Virus X.

[39049] VGAM1066 precursor RNA folds onto itself, forming VGAM1066 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by

miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[39050] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1066 folded precursor RNA into VGAM1066 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 71%) nucleotide sequence of VGAM1066 RNA is designated SEQ ID:3777, and is provided hereinbelow with reference to the sequence listing part.

[39051] VGAM1066 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1066 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1066 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[39052] VGAM1066 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1066 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1066 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1066 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1066 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[39053] The complementary binding of VGAM1066 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM1066 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1066 host target RNA into VGAM1066 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[39054] It is appreciated that VGAM1066 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1066 host target genes. The mRNA of each one of this plurality of VGAM1066 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1066 RNA, herein designated VGAM RNA, and which when bound by VGAM1066 RNA causes inhibition of translation of respective one or more VGAM1066 host target proteins.

[39055] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1066 gene, herein designated VGAM GENE, on one or more VGAM1066 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[39056] It is yet further appreciated that a function of VGAM1066 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1066 include diagnosis, prevention and treatment of viral infection by Tulip Virus X. Specific functions, and accordingly utilities, of VGAM1066 correlate with, and may be deduced from, the identity of the host target genes which VGAM1066 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[39057] Nucleotide sequences of the VGAM1066 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM1066 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1066 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1066 are further described hereinbelow with reference to Table 1.

[39058] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1066 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1066 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[39059] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1066 gene, herein designated VGAM is inhibition of expression of VGAM1066 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1066 correlate with, and may be deduced from, the identity of the target genes which VGAM1066 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[39060] Retinal Degeneration, Slow (retinitis pigmentosa 7) (RDS, Accession NM_000322) is a VGAM1066 host target gene. RDS BINDING SITE is HOST TARGET binding site found in

the 5` untranslated region of mRNA encoded by RDS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RDS BINDING SITE, designated SEQ ID:5861, to the nucleotide sequence of VGAM1066 RNA, herein designated VGAM RNA, also designated SEQ ID:3777.

[39061] A function of VGAM1066 is therefore inhibition of Retinal Degeneration, Slow (retinitis pigmentosa 7) (RDS, Accession NM_000322), a gene which may function as an adhesion molecule involved in stabilization and compaction of outer segment disks or in the maintenance of the curvature of the rim. Accordingly, utilities of VGAM1066 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RDS. The function of RDS and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM341.CUB and Sushi Multiple Domains 1 (CSMD1, Accession XM_054838) is another VGAM1066 host target gene. CSMD1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CSMD1, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CSMD1 BINDING SITE, designated SEQ ID:36190, to the nucleotide sequence of VGAM1066 RNA, herein designated VGAM RNA, also designated SEQ ID:3777.

[39062] Another function of VGAM1066 is therefore inhibition of CUB and Sushi Multiple Domains 1 (CSMD1, Accession XM_054838). Accordingly, utilities of VGAM1066 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CSMD1. GRWD (Accession NM_031485) is another VGAM1066 host target gene. GRWD BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GRWD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GRWD BINDING SITE, designated SEQ ID:25575, to the nucleotide sequence of VGAM1066 RNA, herein designated VGAM RNA, also designated SEQ ID:3777.

[39063] Another function of VGAM1066 is therefore inhibition of GRWD (Accession NM_031485). Accordingly, utilities of

VGAM1066 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GRWD. LOC257364 (Accession XM_170768) is another VGAM1066 host target gene. LOC257364 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC257364, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257364 BINDING SITE, designated SEQ ID:45524, to the nucleotide sequence of VGAM1066 RNA, herein designated VGAM RNA, also designated SEQ ID:3777.

[39064] Another function of VGAM1066 is therefore inhibition of LOC257364 (Accession XM_170768). Accordingly, utilities of VGAM1066 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257364. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1067 (VGAM1067) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[39065] VGAM1067 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1067 was detected is described hereinabove with reference to Figs. 1–8.

[39066] VGAM1067 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Porcine Epidemic Diarrhea Virus. VGAM1067 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[39067] VGAM1067 gene encodes a VGAM1067 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1067 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1067 precursor RNA is designated SEQ ID:1053, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1053 is located at position 2170 relative to the genome of Porcine Epidemic Diarrhea Virus.

[39068] VGAM1067 precursor RNA folds onto itself, forming VGAM1067 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the

art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[39069] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1067 folded precursor RNA into VGAM1067 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1067 RNA is designated SEQ ID:3778, and is provided hereinbelow with reference to the sequence listing part.

[39070] VGAM1067 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1067 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1067 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated

5`UTR, PROTEIN CODING and 3`UTR respectively.

[39071] VGAM1067 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1067 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1067 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1067 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1067 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[39072] The complementary binding of VGAM1067 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1067 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1067 host target RNA into VGAM1067 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[39073] It is appreciated that VGAM1067 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1067 host target genes. The mRNA of each one of this plurality of VGAM1067 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1067 RNA, herein designated VGAM RNA, and which when bound by VGAM1067 RNA causes inhibition of translation of respective one or more VGAM1067 host target proteins.

[39074] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1067 gene, herein designated VGAM GENE, on one or more VGAM1067 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[39075] It is yet further appreciated that a function of VGAM1067 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1067 include diagnosis, prevention and treatment of viral infection by Porcine Epidemic Diarrhea Virus. Specific functions, and accordingly utilities, of VGAM1067 correlate with, and may be deduced from, the identity of the host target genes which VGAM1067 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[39076] Nucleotide sequences of the VGAM1067 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the
`diced` VGAM1067 RNA, herein designated VGAM RNA,
and a schematic representation of the secondary folding
of VGAM1067 folded precursor RNA, herein designated
VGAM FOLDED PRECURSOR RNA, of VGAM1067 are further
described hereinbelow with reference to Table 1.

[39077] Nucleotide sequences of host target binding sites, such as
BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of
Fig. 1, found on VGAM1067 host target RNA, and
schematic representation of the complementarity of each
of these host target binding sites to VGAM1067 RNA,
herein designated VGAM RNA, are described hereinbelow
with reference to Table 2.

[39078] As mentioned hereinabove with reference to Fig. 1, a
function of VGAM1067 gene, herein designated VGAM is
inhibition of expression of VGAM1067 target genes. It is
appreciated that specific functions, and accordingly utili-
ties, of VGAM1067 correlate with, and may be deduced
from, the identity of the target genes which VGAM1067
binds and inhibits, and the function of these target genes,
as elaborated hereinbelow.

[39079] UDP-Gal:betaGlcNAc Beta 1,4- Galactosyltransferase,
Polypeptide 6 (B4GALT6, Accession XM_008799) is a

VGAM1067 host target gene. B4GALT6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by B4GALT6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of B4GALT6 BINDING SITE, designated SEQ ID:30094, to the nucleotide sequence of VGAM1067 RNA, herein designated VGAM RNA, also designated SEQ ID:3778.

[39080] A function of VGAM1067 is therefore inhibition of UDP-Gal:betaGlcNAc Beta 1,4- Galactosyltransferase, Polypeptide 6 (B4GALT6, Accession XM_008799). Accordingly, utilities of VGAM1067 include diagnosis, prevention and treatment of diseases and clinical conditions associated with B4GALT6. CDC-like Kinase 2 (CLK2, Accession NM_001291) is another VGAM1067 host target gene. CLK2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CLK2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLK2 BINDING SITE, designated SEQ ID:6973, to the nucleotide sequence of VGAM1067 RNA, herein

designated VGAM RNA, also designated SEQ ID:3778.

[39081] Another function of VGAM1067 is therefore inhibition of CDC-like Kinase 2 (CLK2, Accession NM_001291), a gene which catalyzes the phosphorylation of proteins. Accordingly, utilities of VGAM1067 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLK2. The function of CLK2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM356. Cannabinoid Receptor 1 (brain) (CNR1, Accession NM_016083) is another VGAM1067 host target gene. CNR1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CNR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CNR1 BINDING SITE, designated SEQ ID:18164, to the nucleotide sequence of VGAM1067 RNA, herein designated VGAM RNA, also designated SEQ ID:3778.

[39082] Another function of VGAM1067 is therefore inhibition of Cannabinoid Receptor 1 (brain) (CNR1, Accession NM_016083), a gene which is involved in the cannabi-

noid-induced CNS effects. Accordingly, utilities of VGAM1067 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CNR1. The function of CNR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM533. Laminin, Gamma 1 (formerly LAMB2) (LAMC1, Accession NM_002293) is another VGAM1067 host target gene. LAMC1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LAMC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LAMC1 BINDING SITE, designated SEQ ID:8077, to the nucleotide sequence of VGAM1067 RNA, herein designated VGAM RNA, also designated SEQ ID:3778.

[39083] Another function of VGAM1067 is therefore inhibition of Laminin, Gamma 1 (formerly LAMB2) (LAMC1, Accession NM_002293), a gene which may mediate the attachment, migration, and organization of cells into tissues. Accordingly, utilities of VGAM1067 include diagnosis, prevention and treatment of diseases and clinical conditions associ-

ated with LAMC1. The function of LAMC1 and its association with various diseases and clinical conditions, has been established by previous studies, as described herein above with reference to VGAM812. KIAA1674 (Accession XM_044065) is another VGAM1067 host target gene.

KIAA1674 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1674, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1674 BINDING SITE, designated SEQ ID:34114, to the nucleotide sequence of VGAM1067 RNA, herein designated VGAM RNA, also designated SEQ ID:3778.

[39084] Another function of VGAM1067 is therefore inhibition of KIAA1674 (Accession XM_044065). Accordingly, utilities of VGAM1067 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1674. LOC147093 (Accession XM_097184) is another VGAM1067 host target gene. LOC147093 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC147093, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147093 BINDING SITE, designated SEQ ID:40804, to the nucleotide sequence of VGAM1067 RNA, herein designated VGAM RNA, also designated SEQ ID:3778.

[39085] Another function of VGAM1067 is therefore inhibition of LOC147093 (Accession XM_097184). Accordingly, utilities of VGAM1067 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147093. LOC170395 (Accession XM_084325) is another VGAM1067 host target gene. LOC170395 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC170395, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC170395 BINDING SITE, designated SEQ ID:37546, to the nucleotide sequence of VGAM1067 RNA, herein designated VGAM RNA, also designated SEQ ID:3778.

[39086] Another function of VGAM1067 is therefore inhibition of LOC170395 (Accession XM_084325). Accordingly, utilities of VGAM1067 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC170395. LOC200609 (Accession XM_117256) is another VGAM1067 host target gene. LOC200609 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC200609, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200609 BINDING SITE, designated SEQ ID:43331, to the nucleotide sequence of VGAM1067 RNA, herein designated VGAM RNA, also designated SEQ ID:3778.

[39087] Another function of VGAM1067 is therefore inhibition of LOC200609 (Accession XM_117256). Accordingly, utilities of VGAM1067 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200609. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1068 (VGAM1068) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[39088] VGAM1068 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM1068 was detected is described hereinabove with reference to Figs. 1–8.

[39089] VGAM1068 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Porcine Epidemic Diarrhea Virus. VGAM1068 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[39090] VGAM1068 gene encodes a VGAM1068 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1068 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1068 precursor RNA is designated SEQ ID:1054, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1054 is located at position 12381 relative to the genome of Porcine Epidemic Diarrhea Virus.

[39091] VGAM1068 precursor RNA folds onto itself, forming VGAM1068 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide

sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[39092] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1068 folded precursor RNA into VGAM1068 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 50%) nucleotide sequence of VGAM1068 RNA is designated SEQ ID:3779, and is provided hereinbelow with reference to the sequence listing part.

[39093] VGAM1068 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1068 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1068 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[39094] VGAM1068 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM1068 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1068 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1068 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1068 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[39095] The complementary binding of VGAM1068 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM1068 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1068 host target RNA into VGAM1068 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[39096] It is appreciated that VGAM1068 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1068 host target genes. The mRNA of each one of this plurality of VGAM1068 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1068 RNA, herein designated VGAM RNA, and which when bound by VGAM1068 RNA causes inhibition of translation of respective one or more VGAM1068 host target proteins.

[39097] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1068 gene, herein designated VGAM GENE, on one or more VGAM1068 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[39098] It is yet further appreciated that a function of VGAM1068 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1068 include diagnosis, prevention and treatment of viral infection by Porcine Epidemic Diarrhea Virus. Specific functions, and accordingly utilities, of VGAM1068 correlate with, and may be deduced from, the identity of the host target genes which VGAM1068 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[39099] Nucleotide sequences of the VGAM1068 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1068 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM1068 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1068 are further described hereinbelow with reference to Table 1.

[39100] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1068 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1068 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[39101] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1068 gene, herein designated VGAM is inhibition of expression of VGAM1068 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1068 correlate with, and may be deduced from, the identity of the target genes which VGAM1068 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[39102] Nuclear Receptor Subfamily 5, Group A, Member 2 (NR5A2, Accession NM_003822) is a VGAM1068 host target gene. NR5A2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded

by NR5A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NR5A2 BINDING SITE, designated SEQ ID:9914, to the nucleotide sequence of VGAM1068 RNA, herein designated VGAM RNA, also designated SEQ ID:3779.

[39103] A function of VGAM1068 is therefore inhibition of Nuclear Receptor Subfamily 5, Group A, Member 2 (NR5A2, Accession NM_003822), a gene which is a member of nuclear receptor superfamily of transcriptional activators and activates the hepatitis B virus (HBV) promoter. Accordingly, utilities of VGAM1068 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NR5A2. The function of NR5A2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM375. Pyruvate Dehydrogenase Kinase, Isoenzyme 4 (PDK4, Accession XM_173198) is another VGAM1068 host target gene. PDK4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PDK4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDK4 BINDING SITE, designated SEQ ID:46443, to the nucleotide sequence of VGAM1068 RNA, herein designated VGAM RNA, also designated SEQ ID:3779.

[39104] Another function of VGAM1068 is therefore inhibition of Pyruvate Dehydrogenase Kinase, Isoenzyme 4 (PDK4, Accession XM_173198). Accordingly, utilities of VGAM1068 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDK4. Phosphoinositide-3-kinase, Class 2, Beta Polypeptide (PIK3C2B, Accession NM_002646) is another VGAM1068 host target gene. PIK3C2B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PIK3C2B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PIK3C2B BINDING SITE, designated SEQ ID:8504, to the nucleotide sequence of VGAM1068 RNA, herein designated VGAM RNA, also designated SEQ ID:3779.

[39105] Another function of VGAM1068 is therefore inhibition of Phosphoinositide-3-kinase, Class 2, Beta Polypeptide

(PIK3C2B, Accession NM_002646). Accordingly, utilities of VGAM1068 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIK3C2B. Prostaglandin I₂ (prostacyclin) Synthase (PTGIS, Accession NM_000961) is another VGAM1068 host target gene. PTGIS BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PTGIS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTGIS BINDING SITE, designated SEQ ID:6665, to the nucleotide sequence of VGAM1068 RNA, herein designated VGAM RNA, also designated SEQ ID:3779.

[39106] Another function of VGAM1068 is therefore inhibition of Prostaglandin I₂ (prostacyclin) Synthase (PTGIS, Accession NM_000961), a gene which catalyzes the isomerization of prostaglandin h₂ to prostacyclin (= prostaglandin i₂). Accordingly, utilities of VGAM1068 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTGIS. The function of PTGIS and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM206. Bromodomain Con-

taining 3 (BRD3, Accession NM_007371) is another VGAM1068 host target gene. BRD3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BRD3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BRD3 BINDING SITE, designated SEQ ID:14296, to the nucleotide sequence of VGAM1068 RNA, herein designated VGAM RNA, also designated SEQ ID:3779.

[39107] Another function of VGAM1068 is therefore inhibition of Bromodomain Containing 3 (BRD3, Accession NM_007371). Accordingly, utilities of VGAM1068 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BRD3. Cyclin E2 (CCNE2, Accession NM_057749) is another VGAM1068 host target gene. CCNE2 BINDING SITE1 and CCNE2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by CCNE2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CCNE2 BINDING SITE1 and CCNE2 BINDING SITE2, designated SEQ

ID:27710 and SEQ ID:11049 respectively, to the nucleotide sequence of VGAM1068 RNA, herein designated VGAM RNA, also designated SEQ ID:3779.

[39108] Another function of VGAM1068 is therefore inhibition of Cyclin E2 (CCNE2, Accession NM_057749). Accordingly, utilities of VGAM1068 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CCNE2. KIAA0475 (Accession NM_014864) is another VGAM1068 host target gene. KIAA0475 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0475, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0475 BINDING SITE, designated SEQ ID:16950, to the nucleotide sequence of VGAM1068 RNA, herein designated VGAM RNA, also designated SEQ ID:3779.

[39109] Another function of VGAM1068 is therefore inhibition of KIAA0475 (Accession NM_014864). Accordingly, utilities of VGAM1068 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0475. KIAA0931 (Accession XM_041191) is another VGAM1068 host target gene. KIAA0931 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0931, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0931 BINDING SITE, designated SEQ ID:33486, to the nucleotide sequence of VGAM1068 RNA, herein designated VGAM RNA, also designated SEQ ID:3779.

[39110] Another function of VGAM1068 is therefore inhibition of KIAA0931 (Accession XM_041191). Accordingly, utilities of VGAM1068 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0931. Protocadherin 17 (PCDH17, Accession NM_014459) is another VGAM1068 host target gene. PCDH17 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PCDH17, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDH17 BINDING SITE, designated SEQ ID:15810, to the nucleotide sequence of VGAM1068 RNA, herein designated VGAM RNA, also designated SEQ ID:3779.

[39111] Another function of VGAM1068 is therefore inhibition of Protocadherin 17 (PCDH17, Accession NM_014459). Accordingly, utilities of VGAM1068 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDH17. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1069 (VGAM1069) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[39112] VGAM1069 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1069 was detected is described hereinabove with reference to Figs. 1–8.

[39113] VGAM1069 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Porcine Epidemic Diarrhea Virus. VGAM1069 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[39114] VGAM1069 gene encodes a VGAM1069 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes,

VGAM1069 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1069 precursor RNA is designated SEQ ID:1055, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1055 is located at position 4727 relative to the genome of Porcine Epidemic Diarrhea Virus.

- [39115] VGAM1069 precursor RNA folds onto itself, forming VGAM1069 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [39116] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1069 folded precursor RNA into VGAM1069 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1069 RNA is designated SEQ ID:3780, and is provided hereinbelow with reference to the sequence listing part.

[39117] VGAM1069 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1069 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1069 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[39118] VGAM1069 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1069 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1069 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1069 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1069 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[39119] The complementary binding of VGAM1069 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1069 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1069 host target RNA into VGAM1069 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[39120] It is appreciated that VGAM1069 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1069 host target genes. The mRNA of each one of this plurality of VGAM1069 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1069 RNA, herein designated VGAM RNA, and which when bound by VGAM1069 RNA causes inhibition of translation of respective one or more VGAM1069 host target proteins.

[39121] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1069 gene, herein designated VGAM GENE, on one or more VGAM1069 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[39122] It is yet further appreciated that a function of VGAM1069 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1069 include diagnosis, prevention and treatment of viral infection by Porcine Epidemic Diarrhea Virus. Specific functions, and accordingly utilities, of VGAM1069 correlate with, and may be deduced from, the identity of the host target genes which VGAM1069 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[39123] Nucleotide sequences of the VGAM1069 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1069 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1069 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1069 are further described hereinbelow with reference to Table 1.

[39124] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1069 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1069 RNA, herein designated VGAM RNA, are described hereinbelow

with reference to Table 2.

[39125] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1069 gene, herein designated VGAM is inhibition of expression of VGAM1069 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1069 correlate with, and may be deduced from, the identity of the target genes which VGAM1069 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[39126] A Disintegrin and Metalloproteinase Domain 17 (tumor necrosis factor, alpha, converting enzyme) (ADAM17, Accession NM_021832) is a VGAM1069 host target gene. ADAM17 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ADAM17, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADAM17 BINDING SITE, designated SEQ ID:22407, to the nucleotide sequence of VGAM1069 RNA, herein designated VGAM RNA, also designated SEQ ID:3780.

[39127] A function of VGAM1069 is therefore inhibition of A Disintegrin and Metalloproteinase Domain 17 (tumor necrosis

factor, alpha, converting enzyme) (ADAM17, Accession NM_021832), a gene which member of ADAM family of zinc metalloproteases. Accordingly, utilities of VGAM1069 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADAM17. The function of ADAM17 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM264. Cadherin 3, Type 1, P-cadherin (placental) (CDH3, Accession NM_001793) is another VGAM1069 host target gene. CDH3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CDH3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDH3 BINDING SITE, designated SEQ ID:7544, to the nucleotide sequence of VGAM1069 RNA, herein designated VGAM RNA, also designated SEQ ID:3780.

[39128] Another function of VGAM1069 is therefore inhibition of Cadherin 3, Type 1, P-cadherin (placental) (CDH3, Accession NM_001793), a gene which is a calcium dependent cell adhesion protein. Accordingly, utilities of VGAM1069

include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDH3. The function of CDH3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM210. Transient Receptor Potential Cation Channel, Subfamily M, Member 6 (TRPM6, Accession NM_017662) is another VGAM1069 host target gene. TRPM6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRPM6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRPM6 BINDING SITE, designated SEQ ID:19193, to the nucleotide sequence of VGAM1069 RNA, herein designated VGAM RNA, also designated SEQ ID:3780.

[39129] Another function of VGAM1069 is therefore inhibition of Transient Receptor Potential Cation Channel, Subfamily M, Member 6 (TRPM6, Accession NM_017662), a gene which contains a predicted ion channel domain and a protein kinase domain. Accordingly, utilities of VGAM1069 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRPM6. The function of

TRPM6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM173.CAMP-GEFII (Accession NM_007023) is another VGAM1069 host target gene. CAMP-GEFII BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CAMP-GEFII, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CAMP-GEFII BINDING SITE, designated SEQ ID:13878, to the nucleotide sequence of VGAM1069 RNA, herein designated VGAM RNA, also designated SEQ ID:3780.

[39130] Another function of VGAM1069 is therefore inhibition of CAMP-GEFII (Accession NM_007023). Accordingly, utilities of VGAM1069 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAMP-GEFII. FLJ11827 (Accession NM_025093) is another VGAM1069 host target gene. FLJ11827 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ11827, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of FLJ11827 BINDING SITE, designated SEQ ID:24724, to the nucleotide sequence of VGAM1069 RNA, herein designated VGAM RNA, also designated SEQ ID:3780.

[39131] Another function of VGAM1069 is therefore inhibition of FLJ11827 (Accession NM_025093). Accordingly, utilities of VGAM1069 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11827. FLJ20035 (Accession NM_017631) is another VGAM1069 host target gene. FLJ20035 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20035, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20035 BINDING SITE, designated SEQ ID:19139, to the nucleotide sequence of VGAM1069 RNA, herein designated VGAM RNA, also designated SEQ ID:3780.

[39132] Another function of VGAM1069 is therefore inhibition of FLJ20035 (Accession NM_017631). Accordingly, utilities of VGAM1069 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20035. KIAA0319 (Accession NM_014809) is another

VGAM1069 host target gene. KIAA0319 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0319, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0319 BINDING SITE, designated SEQ ID:16759, to the nucleotide sequence of VGAM1069 RNA, herein designated VGAM RNA, also designated SEQ ID:3780.

[39133] Another function of VGAM1069 is therefore inhibition of KIAA0319 (Accession NM_014809). Accordingly, utilities of VGAM1069 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0319. KIAA0630 (Accession XM_114729) is another VGAM1069 host target gene. KIAA0630 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0630, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0630 BINDING SITE, designated SEQ ID:43060, to the nucleotide sequence of VGAM1069 RNA, herein designated VGAM RNA, also designated SEQ ID:3780.

[39134] Another function of VGAM1069 is therefore inhibition of KIAA0630 (Accession XM_114729). Accordingly, utilities of VGAM1069 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0630. KIAA0924 (Accession NM_014897) is another VGAM1069 host target gene. KIAA0924 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0924, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0924 BINDING SITE, designated SEQ ID:17063, to the nucleotide sequence of VGAM1069 RNA, herein designated VGAM RNA, also designated SEQ ID:3780.

[39135] Another function of VGAM1069 is therefore inhibition of KIAA0924 (Accession NM_014897). Accordingly, utilities of VGAM1069 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0924. YKT6 (Accession NM_006555) is another VGAM1069 host target gene. YKT6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by YKT6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of YKT6 BINDING SITE, designated SEQ ID:13320, to the nucleotide sequence of VGAM1069 RNA, herein designated VGAM RNA, also designated SEQ ID:3780.

[39136] Another function of VGAM1069 is therefore inhibition of YKT6 (Accession NM_006555). Accordingly, utilities of VGAM1069 include diagnosis, prevention and treatment of diseases and clinical conditions associated with YKT6. LOC148413 (Accession XM_086176) is another VGAM1069 host target gene. LOC148413 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC148413, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148413 BINDING SITE, designated SEQ ID:38531, to the nucleotide sequence of VGAM1069 RNA, herein designated VGAM RNA, also designated SEQ ID:3780.

[39137] Another function of VGAM1069 is therefore inhibition of LOC148413 (Accession XM_086176). Accordingly, utilities of VGAM1069 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC148413. LOC150225 (Accession XM_097870) is another VGAM1069 host target gene. LOC150225 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150225, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150225 BINDING SITE, designated SEQ ID:41188, to the nucleotide sequence of VGAM1069 RNA, herein designated VGAM RNA, also designated SEQ ID:3780.

[39138] Another function of VGAM1069 is therefore inhibition of LOC150225 (Accession XM_097870). Accordingly, utilities of VGAM1069 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150225. LOC91812 (Accession XM_040857) is another VGAM1069 host target gene. LOC91812 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC91812, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91812 BINDING SITE, designated SEQ ID:33390, to the nucleotide sequence of VGAM1069 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3780.

[39139] Another function of VGAM1069 is therefore inhibition of LOC91812 (Accession XM_040857). Accordingly, utilities of VGAM1069 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91812. LOC91813 (Accession XM_040862) is another VGAM1069 host target gene. LOC91813 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC91813, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91813 BINDING SITE, designated SEQ ID:33396, to the nucleotide sequence of VGAM1069 RNA, herein designated VGAM RNA, also designated SEQ ID:3780.

[39140] Another function of VGAM1069 is therefore inhibition of LOC91813 (Accession XM_040862). Accordingly, utilities of VGAM1069 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91813. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1070 (VGAM1070) viral gene, which

modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[39141] VGAM1070 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1070 was detected is described hereinabove with reference to Figs. 1–8.

[39142] VGAM1070 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Porcine Epidemic Diarrhea Virus. VGAM1070 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[39143] VGAM1070 gene encodes a VGAM1070 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1070 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1070 precursor RNA is designated SEQ ID:1056, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1056 is located at position 6437 relative to the genome of Porcine Epidemic Diarrhea Virus.

[39144] VGAM1070 precursor RNA folds onto itself, forming

VGAM1070 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[39145] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1070 folded precursor RNA into VGAM1070 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 48%) nucleotide sequence of VGAM1070 RNA is designated SEQ ID:3781, and is provided hereinbelow with reference to the sequence listing part.

[39146] VGAM1070 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1070 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1070 host target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[39147] VGAM1070 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1070 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1070 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1070 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1070 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example

only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[39148] The complementary binding of VGAM1070 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1070 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1070 host target RNA into VGAM1070 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[39149] It is appreciated that VGAM1070 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1070 host target genes. The mRNA of each one of this plurality of VGAM1070 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1070 RNA, herein designated VGAM RNA, and which when bound by VGAM1070 RNA causes inhibition of translation of respective one or more VGAM1070 host target proteins.

[39150] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM1070 gene, herein designated VGAM GENE, on one or more VGAM1070 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[39151] It is yet further appreciated that a function of VGAM1070 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1070 include diagnosis, prevention and treatment of viral infection by Porcine Epidemic Diarrhea Virus. Specific functions, and accordingly utilities, of VGAM1070 correlate with, and may be deduced from, the identity of the host target genes which VGAM1070 binds

and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[39152] Nucleotide sequences of the VGAM1070 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1070 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1070 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1070 are further described hereinbelow with reference to Table 1.

[39153] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1070 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1070 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[39154] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1070 gene, herein designated VGAM is inhibition of expression of VGAM1070 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1070 correlate with, and may be deduced from, the identity of the target genes which VGAM1070 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[39155] Angiopoietin 1 (ANGPT1, Accession NM_001146) is a VGAM1070 host target gene. ANGPT1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ANGPT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ANGPT1 BINDING SITE, designated SEQ ID:6812, to the nucleotide sequence of VGAM1070 RNA, herein designated VGAM RNA, also designated SEQ ID:3781.

[39156] A function of VGAM1070 is therefore inhibition of Angiopoietin 1 (ANGPT1, Accession NM_001146), a gene which binds and activates tie2 receptor by inducing its tyrosine phosphorylation. Accordingly, utilities of VGAM1070 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ANGPT1. The function of ANGPT1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM291. Cyclin-dependent Kinase Inhibitor 2B (p15, inhibits CDK4) (CDKN2B, Accession NM_078487) is another VGAM1070 host target gene. CDKN2B BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CDKN2B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDKN2B BINDING SITE, designated SEQ ID:27806, to the nucleotide sequence of VGAM1070 RNA, herein designated VGAM RNA, also designated SEQ ID:3781.

[39157] Another function of VGAM1070 is therefore inhibition of Cyclin-dependent Kinase Inhibitor 2B (p15, inhibits CDK4) (CDKN2B, Accession NM_078487). Accordingly, utilities of VGAM1070 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDKN2B. ATIP1 (Accession NM_020749) is another VGAM1070 host target gene. ATIP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ATIP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATIP1 BINDING SITE, designated SEQ ID:21862, to the nucleotide sequence of VGAM1070 RNA, herein designated VGAM RNA, also designated SEQ ID:3781.

[39158] Another function of VGAM1070 is therefore inhibition of ATIP1 (Accession NM_020749). Accordingly, utilities of VGAM1070 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATIP1. FLJ11273 (Accession NM_018374) is another VGAM1070 host target gene. FLJ11273 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ11273, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11273 BINDING SITE, designated SEQ ID:20395, to the nucleotide sequence of VGAM1070 RNA, herein designated VGAM RNA, also designated SEQ ID:3781.

[39159] Another function of VGAM1070 is therefore inhibition of FLJ11273 (Accession NM_018374). Accordingly, utilities of VGAM1070 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11273. FLJ20716 (Accession NM_017938) is another VGAM1070 host target gene. FLJ20716 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20716, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20716 BINDING SITE, designated SEQ ID:19630, to the nucleotide sequence of VGAM1070 RNA, herein designated VGAM RNA, also designated SEQ ID:3781.

[39160] Another function of VGAM1070 is therefore inhibition of FLJ20716 (Accession NM_017938). Accordingly, utilities of VGAM1070 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20716. MGC13138 (Accession NM_033410) is another VGAM1070 host target gene. MGC13138 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC13138, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC13138 BINDING SITE, designated SEQ ID:27230, to the nucleotide sequence of VGAM1070 RNA, herein designated VGAM RNA, also designated SEQ ID:3781.

[39161] Another function of VGAM1070 is therefore inhibition of MGC13138 (Accession NM_033410). Accordingly, utilities of VGAM1070 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

MGC13138. QKI (Accession XM_037438) is another VGAM1070 host target gene. QKI BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by QKI, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of QKI BINDING SITE, designated SEQ ID:32616, to the nucleotide sequence of VGAM1070 RNA, herein designated VGAM RNA, also designated SEQ ID:3781.

[39162] Another function of VGAM1070 is therefore inhibition of QKI (Accession XM_037438). Accordingly, utilities of VGAM1070 include diagnosis, prevention and treatment of diseases and clinical conditions associated with QKI. LOC148188 (Accession XM_086088) is another VGAM1070 host target gene. LOC148188 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC148188, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148188 BINDING SITE, designated SEQ ID:38489, to the nucleotide sequence of VGAM1070 RNA, herein design-

nated VGAM RNA, also designated SEQ ID:3781.

[39163] Another function of VGAM1070 is therefore inhibition of LOC148188 (Accession XM_086088). Accordingly, utilities of VGAM1070 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148188. LOC201522 (Accession XM_113978) is another VGAM1070 host target gene. LOC201522 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC201522, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201522 BINDING SITE, designated SEQ ID:42585, to the nucleotide sequence of VGAM1070 RNA, herein designated VGAM RNA, also designated SEQ ID:3781.

[39164] Another function of VGAM1070 is therefore inhibition of LOC201522 (Accession XM_113978). Accordingly, utilities of VGAM1070 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201522. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1071 (VGAM1071) viral gene, which

modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[39165] VGAM1071 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1071 was detected is described hereinabove with reference to Figs. 1–8.

[39166] VGAM1071 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Porcine Epidemic Diarrhea Virus. VGAM1071 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[39167] VGAM1071 gene encodes a VGAM1071 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1071 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1071 precursor RNA is designated SEQ ID:1057, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1057 is located at position 5412 relative to the genome of Porcine Epidemic Diarrhea Virus.

[39168] VGAM1071 precursor RNA folds onto itself, forming

VGAM1071 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[39169] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1071 folded precursor RNA into VGAM1071 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 49%) nucleotide sequence of VGAM1071 RNA is designated SEQ ID:3782, and is provided hereinbelow with reference to the sequence listing part.

[39170] VGAM1071 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1071 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1071 host target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[39171] VGAM1071 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1071 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1071 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1071 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1071 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example

only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[39172] The complementary binding of VGAM1071 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1071 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1071 host target RNA into VGAM1071 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[39173] It is appreciated that VGAM1071 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1071 host target genes. The mRNA of each one of this plurality of VGAM1071 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1071 RNA, herein designated VGAM RNA, and which when bound by VGAM1071 RNA causes inhibition of translation of respective one or more VGAM1071 host target proteins.

[39174] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM1071 gene, herein designated VGAM GENE, on one or more VGAM1071 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[39175] It is yet further appreciated that a function of VGAM1071 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1071 include diagnosis, prevention and treatment of viral infection by Porcine Epidemic Diarrhea Virus. Specific functions, and accordingly utilities, of VGAM1071 correlate with, and may be deduced from, the identity of the host target genes which VGAM1071 binds

and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[39176] Nucleotide sequences of the VGAM1071 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1071 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1071 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1071 are further described hereinbelow with reference to Table 1.

[39177] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1071 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1071 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[39178] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1071 gene, herein designated VGAM is inhibition of expression of VGAM1071 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1071 correlate with, and may be deduced from, the identity of the target genes which VGAM1071 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[39179] Protein Kinase (cAMP-dependent, catalytic) Inhibitor Alpha (PKIA, Accession NM_006823) is a VGAM1071 host target gene. PKIA BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PKIA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PKIA BINDING SITE, designated SEQ ID:13696, to the nucleotide sequence of VGAM1071 RNA, herein designated VGAM RNA, also designated SEQ ID:3782.

[39180] A function of VGAM1071 is therefore inhibition of Protein Kinase (cAMP-dependent, catalytic) Inhibitor Alpha (PKIA, Accession NM_006823). Accordingly, utilities of VGAM1071 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PKIA. LOC253260 (Accession XM_171097) is another VGAM1071 host target gene. LOC253260 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC253260, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

LOC253260 BINDING SITE, designated SEQ ID:45908, to the nucleotide sequence of VGAM1071 RNA, herein designated VGAM RNA, also designated SEQ ID:3782.

[39181] Another function of VGAM1071 is therefore inhibition of LOC253260 (Accession XM_171097). Accordingly, utilities of VGAM1071 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253260. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1072 (VGAM1072) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[39182] VGAM1072 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1072 was detected is described hereinabove with reference to Figs. 1–8.

[39183] VGAM1072 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Porcine Epidemic Diarrhea Virus. VGAM1072 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[39184] VGAM1072 gene encodes a VGAM1072 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1072 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1072 precursor RNA is designated SEQ ID:1058, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1058 is located at position 10299 relative to the genome of Porcine Epidemic Diarrhea Virus.

[39185] VGAM1072 precursor RNA folds onto itself, forming VGAM1072 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[39186] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1072 folded precursor RNA into VGAM1072 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1072 RNA is designated SEQ ID:3783, and is provided hereinbelow with reference to the sequence listing part.

[39187] VGAM1072 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1072 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1072 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[39188] VGAM1072 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1072 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1072 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1072 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1072 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[39189] The complementary binding of VGAM1072 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1072 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1072 host target RNA into VGAM1072 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[39190] It is appreciated that VGAM1072 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1072 host target genes. The mRNA of each one of this plurality of VGAM1072 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1072 RNA, herein designated VGAM RNA, and which when bound by VGAM1072 RNA causes inhibition of translation of respective one or more VGAM1072 host target proteins.

[39191] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1072 gene, herein designated VGAM GENE, on one or more VGAM1072 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G.,
`Perspective: Glimpses of a tiny RNA world`, Science
294,779 (2001)).

[39192] It is yet further appreciated that a function of VGAM1072 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1072 include diagnosis, prevention and treatment of viral infection by Porcine Epidemic Diarrhea Virus. Specific functions, and accordingly utilities, of VGAM1072 correlate with, and may be deduced from, the identity of the host target genes which VGAM1072 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[39193] Nucleotide sequences of the VGAM1072 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1072 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1072 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1072 are further described hereinbelow with reference to Table 1.

[39194] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1072 host target RNA, and

schematic representation of the complementarity of each of these host target binding sites to VGAM1072 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[39195] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1072 gene, herein designated VGAM is inhibition of expression of VGAM1072 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1072 correlate with, and may be deduced from, the identity of the target genes which VGAM1072 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[39196] Sialic Acid Binding Ig-like Lectin 11 (SIGLEC11, Accession NM_052884) is a VGAM1072 host target gene. SIGLEC11 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SIGLEC11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SIGLEC11 BINDING SITE, designated SEQ ID:27463, to the nucleotide sequence of VGAM1072 RNA, herein designated VGAM RNA, also designated SEQ ID:3783.

[39197] A function of VGAM1072 is therefore inhibition of Sialic Acid Binding Ig-like Lectin 11 (SIGLEC11, Accession NM_052884). Accordingly, utilities of VGAM1072 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIGLEC11. KIAA0977 (Accession NM_014900) is another VGAM1072 host target gene. KIAA0977 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0977, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0977 BINDING SITE, designated SEQ ID:17081, to the nucleotide sequence of VGAM1072 RNA, herein designated VGAM RNA, also designated SEQ ID:3783.

[39198] Another function of VGAM1072 is therefore inhibition of KIAA0977 (Accession NM_014900). Accordingly, utilities of VGAM1072 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0977. SEC24 Related Gene Family, Member A (*S. cerevisiae*) (SEC24A, Accession XM_094581) is another VGAM1072 host target gene. SEC24A BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by SEC24A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEC24A BINDING SITE, designated SEQ ID:40236, to the nucleotide sequence of VGAM1072 RNA, herein designated VGAM RNA, also designated SEQ ID:3783.

[39199] Another function of VGAM1072 is therefore inhibition of SEC24 Related Gene Family, Member A (*S. cerevisiae*) (SEC24A, Accession XM_094581). Accordingly, utilities of VGAM1072 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEC24A. LOC146050 (Accession XM_085301) is another VGAM1072 host target gene. LOC146050 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146050, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146050 BINDING SITE, designated SEQ ID:38054, to the nucleotide sequence of VGAM1072 RNA, herein designated VGAM RNA, also designated SEQ ID:3783.

[39200] Another function of VGAM1072 is therefore inhibition of

LOC146050 (Accession XM_085301). Accordingly, utilities of VGAM1072 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146050. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1073 (VGAM1073) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[39201] VGAM1073 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1073 was detected is described hereinabove with reference to Figs. 1-8.

[39202] VGAM1073 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Porcine Epidemic Diarrhea Virus. VGAM1073 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[39203] VGAM1073 gene encodes a VGAM1073 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1073 precursor RNA does not encode a protein. A

nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1073 precursor RNA is designated SEQ ID:1059, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1059 is located at position 11550 relative to the genome of Porcine Epidemic Diarrhea Virus.

- [39204] VGAM1073 precursor RNA folds onto itself, forming VGAM1073 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [39205] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1073 folded precursor RNA into VGAM1073 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide se-

quence of VGAM1073 RNA is designated SEQ ID:3784, and is provided hereinbelow with reference to the sequence listing part.

[39206] VGAM1073 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1073 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1073 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[39207] VGAM1073 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1073 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1073 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting – VGAM1073 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1073 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[39208] The complementary binding of VGAM1073 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1073 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1073 host target RNA into VGAM1073 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[39209] It is appreciated that VGAM1073 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1073 host target genes. The mRNA of each one of this plurality of VGAM1073 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM1073 RNA, herein designated VGAM RNA, and which when bound by VGAM1073 RNA causes inhibition of translation of respective one or more VGAM1073 host target proteins.

[39210] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1073 gene, herein designated VGAM GENE, on one or more VGAM1073 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[39211] It is yet further appreciated that a function of VGAM1073

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1073 include diagnosis, prevention and treatment of viral infection by Porcine Epidemic Diarrhea Virus. Specific functions, and accordingly utilities, of VGAM1073 correlate with, and may be deduced from, the identity of the host target genes which VGAM1073 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[39212] Nucleotide sequences of the VGAM1073 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1073 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1073 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1073 are further described hereinbelow with reference to Table 1.

[39213] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1073 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1073 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[39214] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1073 gene, herein designated VGAM is inhibition of expression of VGAM1073 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1073 correlate with, and may be deduced from, the identity of the target genes which VGAM1073 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[39215] Lipase, Member I (LIPI, Accession XM_086767) is a VGAM1073 host target gene. LIPI BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LIPI, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LIPI BINDING SITE, designated SEQ ID:38843, to the nucleotide sequence of VGAM1073 RNA, herein designated VGAM RNA, also designated SEQ ID:3784.

[39216] A function of VGAM1073 is therefore inhibition of Lipase, Member I (LIPI, Accession XM_086767). Accordingly, utilities of VGAM1073 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LIPI. PRO0902 (Accession NM_053057) is another

VGAM1073 host target gene. PRO0902 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PRO0902, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO0902 BINDING SITE, designated SEQ ID:27607, to the nucleotide sequence of VGAM1073 RNA, herein designated VGAM RNA, also designated SEQ ID:3784.

[39217] Another function of VGAM1073 is therefore inhibition of PRO0902 (Accession NM_053057). Accordingly, utilities of VGAM1073 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO0902. LOC153937 (Accession XM_087813) is another VGAM1073 host target gene. LOC153937 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC153937, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153937 BINDING SITE, designated SEQ ID:39445, to the nucleotide sequence of VGAM1073 RNA, herein designated VGAM RNA, also designated SEQ ID:3784.

[39218] Another function of VGAM1073 is therefore inhibition of LOC153937 (Accession XM_087813). Accordingly, utilities of VGAM1073 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153937. LOC51028 (Accession NM_016075) is another VGAM1073 host target gene. LOC51028 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51028, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51028 BINDING SITE, designated SEQ ID:18149, to the nucleotide sequence of VGAM1073 RNA, herein designated VGAM RNA, also designated SEQ ID:3784.

[39219] Another function of VGAM1073 is therefore inhibition of LOC51028 (Accession NM_016075). Accordingly, utilities of VGAM1073 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51028. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1074 (VGAM1074) viral gene, which modulates expression of respective host target genes

thereof, the function and utility of which host target genes is known in the art.

[39220] VGAM1074 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1074 was detected is described hereinabove with reference to Figs. 1-8.

[39221] VGAM1074 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Porcine Epidemic Diarrhea Virus. VGAM1074 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[39222] VGAM1074 gene encodes a VGAM1074 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1074 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1074 precursor RNA is designated SEQ ID:1060, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1060 is located at position 2902 relative to the genome of Porcine Epidemic Diarrhea Virus.

[39223] VGAM1074 precursor RNA folds onto itself, forming VGAM1074 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[39224] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1074 folded precursor RNA into VGAM1074 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1074 RNA is designated SEQ ID:3785, and is provided hereinbelow with reference to the sequence listing part.

[39225] VGAM1074 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1074 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1074 host target RNA comprises three regions, as is typical of mRNA of a pro-

tein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[39226] VGAM1074 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1074 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1074 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1074 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1074 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[39227] The complementary binding of VGAM1074 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1074 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1074 host target RNA into VGAM1074 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[39228] It is appreciated that VGAM1074 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1074 host target genes. The mRNA of each one of this plurality of VGAM1074 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1074 RNA, herein designated VGAM RNA, and which when bound by VGAM1074 RNA causes inhibition of translation of respective one or more VGAM1074 host target proteins.

[39229] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM1074 gene, herein designated VGAM GENE, on one or more VGAM1074 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[39230] It is yet further appreciated that a function of VGAM1074 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1074 include diagnosis, prevention and treatment of viral infection by Porcine Epidemic Diarrhea Virus. Specific functions, and accordingly utilities, of VGAM1074 correlate with, and may be deduced from, the identity of the host target genes which VGAM1074 binds and inhibits, and the function of these host target genes,

as elaborated hereinbelow.

[39231] Nucleotide sequences of the VGAM1074 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1074 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1074 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1074 are further described hereinbelow with reference to Table 1.

[39232] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1074 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1074 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[39233] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1074 gene, herein designated VGAM is inhibition of expression of VGAM1074 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1074 correlate with, and may be deduced from, the identity of the target genes which VGAM1074 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[39234] Fibroblast Growth Factor Receptor 2 (bacteria-expressed kinase, keratinocyte growth factor receptor, craniofacial dysostosis 1, Crouzon syndrome, Pfeiffer syndrome, Jackson-Weiss syndrome) (FGFR2, Accession NM_023030) is a VGAM1074 host target gene. FGFR2 BINDING SITE1 through FGFR2 BINDING SITE6 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FGFR2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FGFR2 BINDING SITE1 through FGFR2 BINDING SITE6, designated SEQ ID:23296, SEQ ID:23290, SEQ ID:23236, SEQ ID:23302, SEQ ID:5640 and SEQ ID:23243 respectively, to the nucleotide sequence of VGAM1074 RNA, herein designated VGAM RNA, also designated SEQ ID:3785.

[39235] A function of VGAM1074 is therefore inhibition of Fibroblast Growth Factor Receptor 2 (bacteria-expressed kinase, keratinocyte growth factor receptor, craniofacial dysostosis 1, Crouzon syndrome, Pfeiffer syndrome, Jackson-Weiss syndrome) (FGFR2, Accession NM_023030). Accordingly, utilities of VGAM1074 include diagnosis, prevention and treatment of diseases and clinical conditions associ-

ated with FGFR2. T-cell Leukemia Translocation Altered Gene (TCTA, Accession NM_022171) is another VGAM1074 host target gene. TCTA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TCTA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TCTA BINDING SITE, designated SEQ ID:22728, to the nucleotide sequence of VGAM1074 RNA, herein designated VGAM RNA, also designated SEQ ID:3785.

[39236] Another function of VGAM1074 is therefore inhibition of T-cell Leukemia Translocation Altered Gene (TCTA, Accession NM_022171). Accordingly, utilities of VGAM1074 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TCTA. Abhydrolase Domain Containing 3 (ABHD3, Accession NM_138340) is another VGAM1074 host target gene. ABHD3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ABHD3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

ABHD3 BINDING SITE, designated SEQ ID:28740, to the nucleotide sequence of VGAM1074 RNA, herein designated VGAM RNA, also designated SEQ ID:3785.

[39237] Another function of VGAM1074 is therefore inhibition of Abhydrolase Domain Containing 3 (ABHD3, Accession NM_138340). Accordingly, utilities of VGAM1074 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABHD3. FLJ10781 (Accession NM_018215) is another VGAM1074 host target gene. FLJ10781 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10781, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10781 BINDING SITE, designated SEQ ID:20137, to the nucleotide sequence of VGAM1074 RNA, herein designated VGAM RNA, also designated SEQ ID:3785.

[39238] Another function of VGAM1074 is therefore inhibition of FLJ10781 (Accession NM_018215). Accordingly, utilities of VGAM1074 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10781. FLJ31737 (Accession NM_144984) is another

VGAM1074 host target gene. FLJ31737 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ31737, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ31737 BINDING SITE, designated SEQ ID:29591, to the nucleotide sequence of VGAM1074 RNA, herein designated VGAM RNA, also designated SEQ ID:3785.

[39239] Another function of VGAM1074 is therefore inhibition of FLJ31737 (Accession NM_144984). Accordingly, utilities of VGAM1074 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ31737. Hepatitis B Virus X Associated Protein (HBXAP, Accession NM_016578) is another VGAM1074 host target gene. HBXAP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HBXAP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HBXAP BINDING SITE, designated SEQ ID:18655, to the nucleotide sequence of VGAM1074 RNA, herein designated VGAM RNA, also designated SEQ

ID:3785.

[39240] Another function of VGAM1074 is therefore inhibition of Hepatitis B Virus X Associated Protein (HBXAP, Accession NM_016578). Accordingly, utilities of VGAM1074 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HBXAP. MEGF10 (Accession NM_032446) is another VGAM1074 host target gene. MEGF10 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MEGF10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MEGF10 BINDING SITE, designated SEQ ID:26210, to the nucleotide sequence of VGAM1074 RNA, herein designated VGAM RNA, also designated SEQ ID:3785.

[39241] Another function of VGAM1074 is therefore inhibition of MEGF10 (Accession NM_032446). Accordingly, utilities of VGAM1074 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MEGF10. LOC219333 (Accession XM_167944) is another VGAM1074 host target gene. LOC219333 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by LOC219333, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219333 BINDING SITE, designated SEQ ID:44932, to the nucleotide sequence of VGAM1074 RNA, herein designated VGAM RNA, also designated SEQ ID:3785.

[39242] Another function of VGAM1074 is therefore inhibition of LOC219333 (Accession XM_167944). Accordingly, utilities of VGAM1074 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219333. LOC221405 (Accession XM_168138) is another VGAM1074 host target gene. LOC221405 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC221405, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221405 BINDING SITE, designated SEQ ID:45066, to the nucleotide sequence of VGAM1074 RNA, herein designated VGAM RNA, also designated SEQ ID:3785.

[39243] Another function of VGAM1074 is therefore inhibition of LOC221405 (Accession XM_168138). Accordingly, utilities

of VGAM1074 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221405. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1075 (VGAM1075) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[39244] VGAM1075 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1075 was detected is described hereinabove with reference to Figs. 1-8.

[39245] VGAM1075 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Porcine Epidemic Diarrhea Virus. VGAM1075 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[39246] VGAM1075 gene encodes a VGAM1075 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1075 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nu-

cleotide sequence of VGAM1075 precursor RNA is designated SEQ ID:1061, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1061 is located at position 17939 relative to the genome of Porcine Epidemic Diarrhea Virus.

- [39247] VGAM1075 precursor RNA folds onto itself, forming VGAM1075 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [39248] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1075 folded precursor RNA into VGAM1075 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 49%) nucleotide sequence of VGAM1075 RNA is designated SEQ ID:3786, and

is provided hereinbelow with reference to the sequence listing part.

[39249] VGAM1075 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1075 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1075 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[39250] VGAM1075 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1075 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1075 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing – VGAM1075 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1075 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[39251] The complementary binding of VGAM1075 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1075 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1075 host target RNA into VGAM1075 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[39252] It is appreciated that VGAM1075 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1075 host target genes. The mRNA of each one of this plurality of VGAM1075 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com–

plementary to VGAM1075 RNA, herein designated VGAM RNA, and which when bound by VGAM1075 RNA causes inhibition of translation of respective one or more VGAM1075 host target proteins.

[39253] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1075 gene, herein designated VGAM GENE, on one or more VGAM1075 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[39254] It is yet further appreciated that a function of VGAM1075 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1075 include diagnosis, prevention and treatment of viral infection by Porcine Epidemic Diarrhea Virus. Specific functions, and accordingly utilities, of VGAM1075 correlate with, and may be deduced from, the identity of the host target genes which VGAM1075 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[39255] Nucleotide sequences of the VGAM1075 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1075 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1075 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1075 are further described hereinbelow with reference to Table 1.

[39256] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1075 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1075 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[39257] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM1075 gene, herein designated VGAM is inhibition of expression of VGAM1075 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1075 correlate with, and may be deduced from, the identity of the target genes which VGAM1075 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[39258] KIAA0630 (Accession XM_114729) is a VGAM1075 host target gene. KIAA0630 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0630, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0630 BINDING SITE, designated SEQ ID:43062, to the nucleotide sequence of VGAM1075 RNA, herein designated VGAM RNA, also designated SEQ ID:3786.

[39259] A function of VGAM1075 is therefore inhibition of KIAA0630 (Accession XM_114729). Accordingly, utilities of VGAM1075 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0630. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 1076 (VGAM1076) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[39260] VGAM1076 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1076 was detected is described hereinabove with reference to Figs. 1–8.

[39261] VGAM1076 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Porcine Epidemic Diarrhea Virus. VGAM1076 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[39262] VGAM1076 gene encodes a VGAM1076 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1076 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1076 precursor RNA is designated SEQ ID:1062, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1062 is located at position 17488 relative to the

genome of Porcine Epidemic Diarrhea Virus.

[39263] VGAM1076 precursor RNA folds onto itself, forming VGAM1076 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[39264] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1076 folded precursor RNA into VGAM1076 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1076 RNA is designated SEQ ID:3787, and is provided hereinbelow with reference to the sequence listing part.

[39265] VGAM1076 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM1076 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1076 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[39266] VGAM1076 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1076 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1076 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1076 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1076 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[39267] The complementary binding of VGAM1076 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1076 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1076 host target RNA into VGAM1076 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[39268] It is appreciated that VGAM1076 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1076 host target genes. The mRNA of each one of this plurality of VGAM1076 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1076 RNA, herein designated VGAM RNA, and which when bound by VGAM1076 RNA causes inhibition of translation of respective one or more VGAM1076 host target proteins.

[39269] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1076 gene, herein designated VGAM GENE, on one or more VGAM1076 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[39270] It is yet further appreciated that a function of VGAM1076 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1076 include diagnosis, prevention and treatment of viral infection by Porcine Epidemic Diarrhea Virus. Specific functions, and accordingly utilities, of

VGAM1076 correlate with, and may be deduced from, the identity of the host target genes which VGAM1076 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[39271] Nucleotide sequences of the VGAM1076 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1076 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1076 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1076 are further described hereinbelow with reference to Table 1.

[39272] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1076 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1076 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[39273] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1076 gene, herein designated VGAM is inhibition of expression of VGAM1076 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1076 correlate with, and may be deduced

from, the identity of the target genes which VGAM1076 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[39274] Indolethylamine N-methyltransferase (INMT, Accession NM_006774) is a VGAM1076 host target gene. INMT BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by INMT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of INMT BINDING SITE, designated SEQ ID:13648, to the nucleotide sequence of VGAM1076 RNA, herein designated VGAM RNA, also designated SEQ ID:3787.

[39275] A function of VGAM1076 is therefore inhibition of Indolethylamine N-methyltransferase (INMT, Accession NM_006774). Accordingly, utilities of VGAM1076 include diagnosis, prevention and treatment of diseases and clinical conditions associated with INMT. SRGAP1 (Accession XM_051143) is another VGAM1076 host target gene. SRGAP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SRGAP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2

illustrates the complementarity of the nucleotide sequences of SRGAP1 BINDING SITE, designated SEQ ID:35758, to the nucleotide sequence of VGAM1076 RNA, herein designated VGAM RNA, also designated SEQ ID:3787.

[39276] Another function of VGAM1076 is therefore inhibition of SRGAP1 (Accession XM_051143). Accordingly, utilities of VGAM1076 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SRGAP1. Von Hippel–Lindau Syndrome (VHL, Accession NM_000551) is another VGAM1076 host target gene. VHL BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by VHL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VHL BINDING SITE, designated SEQ ID:6157, to the nucleotide sequence of VGAM1076 RNA, herein designated VGAM RNA, also designated SEQ ID:3787.

[39277] Another function of VGAM1076 is therefore inhibition of Von Hippel–Lindau Syndrome (VHL, Accession NM_000551), a gene which may control rna stability through the selective degradation of rna-bound proteins.

Accordingly, utilities of VGAM1076 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VHL. The function of VHL and its association with various diseases and clinical conditions, has been established by previous studies, as described herein above with reference to VGAM197. DKFZP566F2124 (Accession NM_015630) is another VGAM1076 host target gene. DKFZP566F2124 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP566F2124, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP566F2124 BINDING SITE, designated SEQ ID:17891, to the nucleotide sequence of VGAM1076 RNA, herein designated VGAM RNA, also designated SEQ ID:3787.

[39278] Another function of VGAM1076 is therefore inhibition of DKFZP566F2124 (Accession NM_015630). Accordingly, utilities of VGAM1076 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP566F2124. FLJ13910 (Accession NM_022780) is another VGAM1076 host target gene. FLJ13910 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by FLJ13910, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13910 BINDING SITE, designated SEQ ID:23052, to the nucleotide sequence of VGAM1076 RNA, herein designated VGAM RNA, also designated SEQ ID:3787.

[39279] Another function of VGAM1076 is therefore inhibition of FLJ13910 (Accession NM_022780). Accordingly, utilities of VGAM1076 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13910. FLJ22679 (Accession NM_017698) is another VGAM1076 host target gene. FLJ22679 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22679, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22679 BINDING SITE, designated SEQ ID:19265, to the nucleotide sequence of VGAM1076 RNA, herein designated VGAM RNA, also designated SEQ ID:3787.

[39280] Another function of VGAM1076 is therefore inhibition of FLJ22679 (Accession NM_017698). Accordingly, utilities of

VGAM1076 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22679. Pleiomorphic Adenoma Gene-like 2 (PLAGL2, Accession XM_047007) is another VGAM1076 host target gene. PLAGL2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PLAGL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLAGL2 BINDING SITE, designated SEQ ID:34879, to the nucleotide sequence of VGAM1076 RNA, herein designated VGAM RNA, also designated SEQ ID:3787.

[39281] Another function of VGAM1076 is therefore inhibition of Pleiomorphic Adenoma Gene-like 2 (PLAGL2, Accession XM_047007). Accordingly, utilities of VGAM1076 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLAGL2. Rho-related BTB Domain Containing 2 (RHOBTB2, Accession XM_027679) is another VGAM1076 host target gene. RHOBTB2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RHOBTB2, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RHOBTB2 BINDING SITE, designated SEQ ID:30561, to the nucleotide sequence of VGAM1076 RNA, herein designated VGAM RNA, also designated SEQ ID:3787.

[39282] Another function of VGAM1076 is therefore inhibition of Rho-related BTB Domain Containing 2 (RHOBTB2, Accession XM_027679). Accordingly, utilities of VGAM1076 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RHOBTB2. UCK1 (Accession NM_031432) is another VGAM1076 host target gene. UCK1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by UCK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UCK1 BINDING SITE, designated SEQ ID:25427, to the nucleotide sequence of VGAM1076 RNA, herein designated VGAM RNA, also designated SEQ ID:3787.

[39283] Another function of VGAM1076 is therefore inhibition of UCK1 (Accession NM_031432). Accordingly, utilities of VGAM1076 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UCK1.

LOC149465 (Accession XM_086543) is another VGAM1076 host target gene. LOC149465 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149465, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149465 BINDING SITE, designated SEQ ID:38758, to the nucleotide sequence of VGAM1076 RNA, herein designated VGAM RNA, also designated SEQ ID:3787.

[39284] Another function of VGAM1076 is therefore inhibition of LOC149465 (Accession XM_086543). Accordingly, utilities of VGAM1076 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149465. LOC199858 (Accession XM_114040) is another VGAM1076 host target gene. LOC199858 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC199858, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199858 BINDING SITE, designated SEQ ID:42641, to the nucleotide sequence of VGAM1076 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3787.

[39285] Another function of VGAM1076 is therefore inhibition of LOC199858 (Accession XM_114040). Accordingly, utilities of VGAM1076 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199858. LOC201182 (Accession XM_117055) is another VGAM1076 host target gene. LOC201182 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC201182, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201182 BINDING SITE, designated SEQ ID:43210, to the nucleotide sequence of VGAM1076 RNA, herein designated VGAM RNA, also designated SEQ ID:3787.

[39286] Another function of VGAM1076 is therefore inhibition of LOC201182 (Accession XM_117055). Accordingly, utilities of VGAM1076 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201182. LOC91050 (Accession XM_035703) is another VGAM1076 host target gene. LOC91050 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91050, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91050 BINDING SITE, designated SEQ ID:32331, to the nucleotide sequence of VGAM1076 RNA, herein designated VGAM RNA, also designated SEQ ID:3787.

[39287] Another function of VGAM1076 is therefore inhibition of LOC91050 (Accession XM_035703). Accordingly, utilities of VGAM1076 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91050. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1077 (VGAM1077) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[39288] VGAM1077 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1077 was detected is described hereinabove with reference to Figs. 1-8.

[39289] VGAM1077 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Porcine Epidemic Diar-

rhea Virus. VGAM1077 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[39290] VGAM1077 gene encodes a VGAM1077 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1077 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1077 precursor RNA is designated SEQ ID:1063, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1063 is located at position 1109 relative to the genome of Porcine Epidemic Diarrhea Virus.

[39291] VGAM1077 precursor RNA folds onto itself, forming VGAM1077 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[39292] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM1077 folded precursor RNA into VGAM1077 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1077 RNA is designated SEQ ID:3788, and is provided hereinbelow with reference to the sequence listing part.

[39293] VGAM1077 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1077 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1077 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[39294] VGAM1077 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1077 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM1077 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1077 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1077 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[39295] The complementary binding of VGAM1077 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1077 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1077 host target RNA into VGAM1077 host target protein,

herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[39296] It is appreciated that VGAM1077 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1077 host target genes. The mRNA of each one of this plurality of VGAM1077 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1077 RNA, herein designated VGAM RNA, and which when bound by VGAM1077 RNA causes inhibition of translation of respective one or more VGAM1077 host target proteins.

[39297] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1077 gene, herein designated VGAM GENE, on one or more VGAM1077 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[39298] It is yet further appreciated that a function of VGAM1077 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1077 include diagnosis, prevention and treatment of viral infection by Porcine Epidemic Diarrhea Virus. Specific functions, and accordingly utilities, of VGAM1077 correlate with, and may be deduced from, the identity of the host target genes which VGAM1077 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[39299] Nucleotide sequences of the VGAM1077 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1077 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1077 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1077 are further described hereinbelow with reference to Table 1.

[39300] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1077 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1077 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[39301] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1077 gene, herein designated VGAM is inhibition of expression of VGAM1077 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1077 correlate with, and may be deduced from, the identity of the target genes which VGAM1077 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[39302] KIAA0618 (Accession NM_014833) is a VGAM1077 host target gene. KIAA0618 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0618, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0618 BINDING SITE, designated SEQ ID:16832, to the nucleotide sequence of

VGAM1077 RNA, herein designated VGAM RNA, also designated SEQ ID:3788.

[39303] A function of VGAM1077 is therefore inhibition of KIAA0618 (Accession NM_014833). Accordingly, utilities of VGAM1077 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0618. KIAA1467 (Accession XM_049605) is another VGAM1077 host target gene. KIAA1467 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1467, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1467 BINDING SITE, designated SEQ ID:35456, to the nucleotide sequence of VGAM1077 RNA, herein designated VGAM RNA, also designated SEQ ID:3788.

[39304] Another function of VGAM1077 is therefore inhibition of KIAA1467 (Accession XM_049605). Accordingly, utilities of VGAM1077 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1467. MO25 (Accession NM_016289) is another VGAM1077 host target gene. MO25 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region

of mRNA encoded by MO25, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MO25 BINDING SITE, designated SEQ ID:18416, to the nucleotide sequence of VGAM1077 RNA, herein designated VGAM RNA, also designated SEQ ID:3788.

[39305] Another function of VGAM1077 is therefore inhibition of MO25 (Accession NM_016289). Accordingly, utilities of VGAM1077 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MO25. LOC129011 (Accession XM_059326) is another VGAM1077 host target gene. LOC129011 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC129011, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC129011 BINDING SITE, designated SEQ ID:36963, to the nucleotide sequence of VGAM1077 RNA, herein designated VGAM RNA, also designated SEQ ID:3788.

[39306] Another function of VGAM1077 is therefore inhibition of LOC129011 (Accession XM_059326). Accordingly, utilities

of VGAM1077 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC129011. LOC145945 (Accession XM_096908) is another VGAM1077 host target gene. LOC145945 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145945, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145945 BINDING SITE, designated SEQ ID:40639, to the nucleotide sequence of VGAM1077 RNA, herein designated VGAM RNA, also designated SEQ ID:3788.

[39307] Another function of VGAM1077 is therefore inhibition of LOC145945 (Accession XM_096908). Accordingly, utilities of VGAM1077 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145945. LOC148534 (Accession XM_086222) is another VGAM1077 host target gene. LOC148534 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC148534, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC148534 BINDING SITE, designated SEQ ID:38549, to the nucleotide sequence of VGAM1077 RNA, herein designated VGAM RNA, also designated SEQ ID:3788.

[39308] Another function of VGAM1077 is therefore inhibition of LOC148534 (Accession XM_086222). Accordingly, utilities of VGAM1077 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148534. LOC150407 (Accession XM_086906) is another VGAM1077 host target gene. LOC150407 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150407, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150407 BINDING SITE, designated SEQ ID:38949, to the nucleotide sequence of VGAM1077 RNA, herein designated VGAM RNA, also designated SEQ ID:3788.

[39309] Another function of VGAM1077 is therefore inhibition of LOC150407 (Accession XM_086906). Accordingly, utilities of VGAM1077 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150407. LOC221354 (Accession XM_166468) is another VGAM1077 host target gene. LOC221354 BINDING

SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221354, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221354 BINDING SITE, designated SEQ ID:44392, to the nucleotide sequence of VGAM1077 RNA, herein designated VGAM RNA, also designated SEQ ID:3788.

[39310] Another function of VGAM1077 is therefore inhibition of LOC221354 (Accession XM_166468). Accordingly, utilities of VGAM1077 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221354. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1078 (VGAM1078) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[39311] VGAM1078 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1078 was detected is described hereinabove with reference to Figs. 1-8.

[39312] VGAM1078 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Porcine Epidemic Diarrhea Virus. VGAM1078 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[39313] VGAM1078 gene encodes a VGAM1078 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1078 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1078 precursor RNA is designated SEQ ID:1064, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1064 is located at position 1314 relative to the genome of Porcine Epidemic Diarrhea Virus.

[39314] VGAM1078 precursor RNA folds onto itself, forming VGAM1078 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence

of the nucleotide sequence of the second half thereof.

[39315] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1078 folded precursor RNA into VGAM1078 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1078 RNA is designated SEQ ID:3789, and is provided hereinbelow with reference to the sequence listing part.

[39316] VGAM1078 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1078 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1078 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[39317] VGAM1078 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1078 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1078 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1078 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1078 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[39318] The complementary binding of VGAM1078 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1078 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM1078 host target RNA into VGAM1078 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[39319] It is appreciated that VGAM1078 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1078 host target genes. The mRNA of each one of this plurality of VGAM1078 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1078 RNA, herein designated VGAM RNA, and which when bound by VGAM1078 RNA causes inhibition of translation of respective one or more VGAM1078 host target proteins.

[39320] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1078 gene, herein designated VGAM GENE, on one or more VGAM1078 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[39321] It is yet further appreciated that a function of VGAM1078 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1078 include diagnosis, prevention and treatment of viral infection by Porcine Epidemic Diarrhea Virus. Specific functions, and accordingly utilities, of VGAM1078 correlate with, and may be deduced from, the identity of the host target genes which VGAM1078 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[39322] Nucleotide sequences of the VGAM1078 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1078 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1078 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM1078 are further described hereinbelow with reference to Table 1.

[39323] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1078 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1078 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[39324] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1078 gene, herein designated VGAM is inhibition of expression of VGAM1078 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1078 correlate with, and may be deduced from, the identity of the target genes which VGAM1078 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[39325] Active BCR-related Gene (ABR, Accession NM_001092) is a VGAM1078 host target gene. ABR BINDING SITE1 and ABR BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ABR, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of ABR BINDING SITE1 and ABR BINDING SITE2, designated SEQ ID:6748 and SEQ ID:22493 respectively, to the nucleotide sequence of VGAM1078 RNA, herein designated VGAM RNA, also designated SEQ ID:3789.

[39326] A function of VGAM1078 is therefore inhibition of Active BCR-related Gene (ABR, Accession NM_001092), a gene which gtpase-activating protein for rac and cdc42. Accordingly, utilities of VGAM1078 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABR. The function of ABR and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM489.Ephrin-A1 (EFNA1, Accession NM_004428) is another VGAM1078 host target gene. EFNA1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EFNA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EFNA1 BINDING SITE, designated SEQ ID:10703, to the nucleotide sequence of VGAM1078 RNA, herein designated VGAM RNA, also designated SEQ

ID:3789.

[39327] Another function of VGAM1078 is therefore inhibition of Ephrin-A1 (EFNA1, Accession NM_004428), a gene which is a ligand of Eph-related receptor tyrosine kinases. Accordingly, utilities of VGAM1078 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EFNA1. The function of EFNA1 has been established by previous studies. Holzman et al. (1990) characterized the product of B61, one of 3 novel genes whose expression in human umbilical vein endothelial cells is induced by tumor necrosis factor-alpha in the presence of cycloheximide (see OMIM Ref. No. 191163). Southern analysis suggested to them that it is an evolutionarily conserved single-copy gene. Although primarily a hydrophilic molecule, it contained both a hydrophobic N-terminal and a hydrophobic C-terminal region. The N-terminal region was typical of a signal peptide, which is consistent with the secreted nature of the protein. The mature form of the predicted protein consists of 187 amino acid residues with a predicted molecular weight of 22,000. Sequence analysis of cDNA clones showed that the protein product of B61 had no significant homology to previously described proteins. Later it was shown to be a

member of the subfamily of ligands that bind to the EPH group of receptor tyrosine kinases. These so-called LERK proteins, also called ephrins, share sequence similarity and are attached to the cell membrane by glycosylphosphatidylinositol (GPI) linkages or by a single transmembrane domain (Cerretti et al., 1996). See 179610 for additional information on ephrins and the Eph receptor family. Pandey et al. (1995) presented evidence that LERK1 is involved in TNF-alpha (OMIM Ref. No. 191160)-induced angiogenesis.

[39328] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[39329] Cerretti, D. P.; Lyman, S. D.; Kozlosky, C. J.; Copeland, N. G.; Gilbert, D. J.; Jenkins, N. A.; Valentine, V.; Kirstein, M. N.; Shapiro, D. N.; Morris, S. W. : The genes encoding the Eph-related receptor tyrosine kinase ligands LERK-1 (EPLG1, Epl1), LERK-3 (EPLG3, Epl3), and LERK-4 (EPLG4, Epl4) are clustered on human chromosome 1 and mouse chromosome 3. *Genomics* 33: 277-282, 1996. ; and

[39330] Pandey, A.; Lindberg, R. A.; Dixit, V. M. : Receptor orphans find a family. *Curr. Biol.* 5: 986-989, 1995.

[39331] Further studies establishing the function and utilities of

EFNA1 are found in John Hopkins OMIM database record ID 191164, and in cited publications numbered 9824–9826 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Oxidised Low Density Lipoprotein (lectin-like) Receptor 1 (OLR1, Accession NM_002543) is another VGAM1078 host target gene. OLR1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by OLR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OLR1 BINDING SITE, designated SEQ ID:8395, to the nucleotide sequence of VGAM1078 RNA, herein designated VGAM RNA, also designated SEQ ID:3789.

[39332] Another function of VGAM1078 is therefore inhibition of Oxidised Low Density Lipoprotein (lectin-like) Receptor 1 (OLR1, Accession NM_002543), a gene which is involved in degradation of oxidized LDL by vascular endothelial cells. Accordingly, utilities of VGAM1078 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OLR1. The function of OLR1 has been established by previous studies. Endothelial cell dysfunction or activation elicited by oxidatively modified low

density lipoprotein (OMIM Ref. No. Ox-LDL) has been implicated in the pathogenesis of atherosclerosis. Vascular endothelial cells internalize and degrade Ox-LDL through a putative receptor-mediated pathway that does not involve macrophage scavenger receptors (see OMIM Ref. No. MSR1; 153622). To identify genes encoding Ox-LDL receptors, Sawamura et al. (1997) transfected mammalian cells with a cDNA expression library derived from bovine aortic endothelial cells and assayed for uptake of labeled Ox-LDL. They recovered a cDNA encoding an Ox-LDL receptor, which they designated lectin-like Ox-LDL receptor-1 (LOX1). Immunofluorescence studies showed that bovine LOX1 is expressed on the cell surface. Sawamura et al. (1997) cloned a cDNA encoding the human homolog of LOX1 by screening a human lung cDNA library with the bovine LOX1 cDNA. Cells stably expressing human LOX1 showed uptake of labeled Ox-LDL. The predicted 273-amino acid human LOX1 protein is 72% identical to bovine LOX1. Its structure is similar to that of C-type lectins such as CD94 (KLRD1) and NKR-P1 (KLRB1). Northern blot analysis revealed that human LOX1 is expressed as a 2.8-kb mRNA in various tissues, with the most abundant expression in placenta. Yamanaka et al. (1998) de-

terminated that LOX1 is expressed in vascular-rich organs but not in lymphocytes. Yamanaka et al. (1998) found that the LOX1 gene spans approximately 15 kb and consists of 6 exons. By fluorescence in situ hybridization, they mapped the gene to 12p12–p13, where genes of the natural killer cell receptors are clustered.

[39333] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[39334] Sawamura, T.; Kume, N.; Aoyama, T.; Moriwaki, H.; Hoshikawa, H.; Aiba, Y.; Tanaka, T.; Miwa, S.; Katsura, Y.; Kita, T.; Masaki, T. : An endothelial receptor for oxidized low-density lipoprotein. *Nature* 386: 73–77, 1997. ; and

[39335] Yamanaka, S.; Zhang, X.-Y.; Miura, K.; Kim, S.; Iwao, H. : The human gene encoding the lectin-type oxidized LDL receptor (OLR1) is a novel member of the natural killer gene complex with.

[39336] Further studies establishing the function and utilities of OLR1 are found in John Hopkins OMIM database record ID 602601, and in cited publications numbered 1112–1113 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Oncostatin M (OSM, Accession NM_020530) is another VGAM1078 host target

gene. OSM BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by OSM, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OSM BINDING SITE, designated SEQ ID:21753, to the nucleotide sequence of VGAM1078 RNA, herein designated VGAM RNA, also designated SEQ ID:3789.

[39337] Another function of VGAM1078 is therefore inhibition of Oncostatin M (OSM, Accession NM_020530), a gene which inhibits the proliferation of a number of tumor cell lines, caused an acute inflammatory reaction. Accordingly, utilities of VGAM1078 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OSM. The function of OSM has been established by previous studies. Oncostatin M, a glycoprotein with an approximate molecular weight of 28,000, was originally isolated from a conditioned medium of human leukemia cells that had been induced to differentiate into macrophage-like cells by treatment with phorbol 12-myristate 13-acetate (Zarling et al., 1986). OSM has the ability to inhibit the growth of human A375 melanoma cells but not normal human fibroblasts; hence, its name. Treatment

with recombinant OSM leads to the inhibition of proliferation and changes in cellular morphology of a number of tumor cell lines derived from a wide variety of tissue types. Rose and Bruce (1991) detected significant similarities in the primary amino acid sequences and predicted secondary structures of OSM, leukemia-inhibitory factor (LIF; 159540), granulocyte colony-stimulating factor (CSF3; 138970), and interleukin-6 (IL6; 147620). Using a panel of DNAs from interspecies somatic cell hybrids, they showed, furthermore, that OSM, like LIF, is located on human chromosome 22. They also demonstrated that OSM has the ability to inhibit the proliferation of murine M1 myeloid leukemic cells and can induce their differentiation into macrophage-like cells, a function shared by LIF, CSF3, and IL6. They proposed that these 4 molecules are structurally related members of a cytokine family that have in common the ability to modulate differentiation of a variety of cell types. Although oncostatin M inhibits the growth of a variety of cancer and other cells, Nair et al. (1992) and Miles et al. (1992) found that it is a potent mitogen for cells derived from HIV-related Kaposi sarcoma (OMIM Ref. No. 148000). Rose et al. (1993) found that the genes for OSM and LIF were segregating when cDNA

probes were hybridized to DNA from somatic cell hybrids containing defined regions of human chromosome 22. They found a contig of approximately 100 kb surrounding the 2 genes which were tandemly arranged in the same transcriptional orientation and separated by approximately 10 kb. The direction of gene transcription was telomeric to centromeric, with the OSM gene located upstream of the LIF gene. The findings constituted strong evidence that OSM and LIF resulted from duplication of a common ancestral gene. Oncostatin M is a member of the IL-6 family of cytokines that is primarily known for its effects on cell growth. In exploration of the potential of oncostatin M as an inflammatory effector, Modur et al. (1997) found that oncostatin M caused an acute inflammatory reaction in vivo and that it colocalized with TNF-secreting cells in chronically inflamed human vascular tissue. It induced transmigration of human neutrophils through monolayers of endothelial cells by stimulating the expression of adhesion molecules and chemokines. The pattern of endothelial cell responses, however, significantly differed from the response to TNF (OMIM Ref. No. 191160). Modur et al. (1997) concluded that oncostatin M, but not other IL-6 family members, fulfilled Koch's postu-

lates as an inflammatory mediator. Since its effects on endothelial cells differ significantly from established mediators like TNF- α , it may uniquely contribute to the inflammatory cycle.

[39338] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[39339] Rose, T. M.; Bruce, A. G. : Oncostatin M is a member of a cytokine family that includes leukemia-inhibitory factor, granulocyte colony-stimulating factor, and interleukin 6. Proc. Nat. Acad. Sci. 88: 8641-8645, 1991. ; and

[39340] Modur, V.; Feldhaus, M. J.; Weyrich, A. S.; Jicha, D. L.; Prescott, S. M.; Zimmerman, G. A.; McIntyre, T. M. : Oncostatin M is a proinflammatory mediator: in vivo effects correlate with end.

[39341] Further studies establishing the function and utilities of OSM are found in John Hopkins OMIM database record ID 165095, and in cited publications numbered 2970-297 and 11683 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Paired Box Gene 2 (PAX2, Accession NM_003987) is another VGAM1078 host target gene. PAX2 BINDING SITE1 and PAX2 BINDING SITE2 are HOST TARGET binding sites

found in untranslated regions of mRNA encoded by PAX2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PAX2 BINDING SITE1 and PAX2 BINDING SITE2, designated SEQ ID:10136 and SEQ ID:10142 respectively, to the nucleotide sequence of VGAM1078 RNA, herein designated VGAM RNA, also designated SEQ ID:3789.

[39342] Another function of VGAM1078 is therefore inhibition of Paired Box Gene 2 (PAX2, Accession NM_003987), a gene which involves in kidney cell differentiation. Accordingly, utilities of VGAM1078 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PAX2. The function of PAX2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM407.S100 Calcium Binding Protein, Beta (neural) (S100B, Accession NM_006272) is another VGAM1078 host target gene. S100B BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by S100B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of S100B BINDING SITE, designated SEQ ID:12955, to the nucleotide sequence of VGAM1078 RNA, herein designated VGAM RNA, also designated SEQ ID:3789.

[39343] Another function of VGAM1078 is therefore inhibition of S100 Calcium Binding Protein, Beta (neural) (S100B, Accession NM_006272), a gene which weakly binds calcium but binds zinc very tightly—distinct binding sites with different affinities exist for both ions on each monomer. Accordingly, utilities of VGAM1078 include diagnosis, prevention and treatment of diseases and clinical conditions associated with S100B. The function of S100B has been established by previous studies. See 176940. The beta-subunit of S100 protein is expressed in glial cells at levels at least tenfold higher than in most other cell types. The brain also contains small amounts of the alpha subunits at levels approximately one-tenth that of the beta subunit. Allore et al. (1988) used genomic and cDNA probes in connection with a panel of rodent-human somatic cell hybrids to assign the S100B gene to 21q22. They suggested that this is a candidate gene for the neurologic disturbances in Down syndrome when present in trisomic state. By in situ hybridization, Duncan et al. (1989) localized the

S100B gene to 21q22.2–q22.3. Allore et al. (1990) isolated overlapping genomic clones spanning the region coding for S100B and its flanking sequences. The intron/exon organization is similar to that of the genes coding for several other members of the S100 protein subfamily. The S100B gene is composed of 3 exons, the first of which specifies the 5–prime untranslated region. Morii et al. (1991) isolated the S100A (OMIM Ref. No. 176940) and S100B genes from a human genomic DNA library. Endonuclease mapping and DNA sequencing showed that both comprise 3 exons and 2 introns. Two $\text{Ca}(2+)$ –binding domains were independently encoded by exons 2 and 3. By spot–blot hybridization analysis of flow–sorted chromosomes, Morii et al. (1991) showed that the S100A and S100B genes are located on chromosome 1 and chromosome 21, respectively. Using restriction endonuclease fragment length variations (RFLV) in multipoint backcrosses, Shimizu et al. (1992) mapped the S100b gene in relation to other genes on mouse chromosome 10. The S100B gene is expressed at high levels in brain primarily by astrocytes. Addition of the disulfide–bonded dimeric form of the protein to primary neuronal and glial cultures and established cell lines induces axonal

extension and alterations in astrocyte proliferation and phenotype. Reeves et al. (1994) demonstrated that the same effects of the S100B protein are exerted in vivo. They found that both astrocytosis and neurite proliferation occurred in transgenic mice expressing elevated levels of S100b. They suggested that these transgenic mice represent a useful model for studies of the role of S100B in glial-neuronal interactions in normal development and function of the brain and for analyzing the significance of elevated levels of the protein in Down syndrome and Alzheimer disease.

[39344] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[39345] Reeves, R. H.; Yao, J.; Crowley, M. R.; Buck, S.; Zhang, X.; Yarowsky, P.; Gearhart, J. D.; Hilt, D. C. : Astrocytosis and axonal proliferation in the hippocampus of S100b transgenic mice. *Proc. Nat. Acad. Sci.* 91: 5359–5363, 1994. ; and

[39346] Shimizu, A.; Sakai, Y.; Ohno, K.; Masaki, S.; Kuwano, R.; Takahashi, Y.; Miyashita, N.; Watanabe, T. : A molecular genetic linkage map of mouse chromosome 10, including the Myb, S100b, P.

[39347] Further studies establishing the function and utilities of S100B are found in John Hopkins OMIM database record ID 176990, and in cited publications numbered 888–890, 1236 and 2742 listed in the bibliography section herein–below, which are also hereby incorporated by reference. SH3–domain Binding Protein 2 (SH3BP2, Accession NM_003023) is another VGAM1078 host target gene. SH3BP2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SH3BP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SH3BP2 BINDING SITE, designated SEQ ID:8946, to the nucleotide sequence of VGAM1078 RNA, herein designated VGAM RNA, also designated SEQ ID:3789.

[39348] Another function of VGAM1078 is therefore inhibition of SH3–domain Binding Protein 2 (SH3BP2, Accession NM_003023). Accordingly, utilities of VGAM1078 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SH3BP2. DKFZP566K023 (Accession NM_015485) is another VGAM1078 host target gene. DKFZP566K023 BINDING SITE is HOST TARGET

binding site found in the 3' untranslated region of mRNA encoded by DKFZP566K023, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP566K023 BINDING SITE, designated SEQ ID:17759, to the nucleotide sequence of VGAM1078 RNA, herein designated VGAM RNA, also designated SEQ ID:3789.

[39349] Another function of VGAM1078 is therefore inhibition of DKFZP566K023 (Accession NM_015485). Accordingly, utilities of VGAM1078 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP566K023. ELKS (Accession NM_015064) is another VGAM1078 host target gene. ELKS BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ELKS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ELKS BINDING SITE, designated SEQ ID:17419, to the nucleotide sequence of VGAM1078 RNA, herein designated VGAM RNA, also designated SEQ ID:3789.

[39350] Another function of VGAM1078 is therefore inhibition of

ELKS (Accession NM_015064). Accordingly, utilities of VGAM1078 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ELKS. FLJ20371 (Accession NM_017791) is another VGAM1078 host target gene. FLJ20371 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20371, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20371 BINDING SITE, designated SEQ ID:19424, to the nucleotide sequence of VGAM1078 RNA, herein designated VGAM RNA, also designated SEQ ID:3789.

[39351] Another function of VGAM1078 is therefore inhibition of FLJ20371 (Accession NM_017791). Accordingly, utilities of VGAM1078 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20371. FLJ23071 (Accession NM_025192) is another VGAM1078 host target gene. FLJ23071 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ23071, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of FLJ23071 BINDING SITE, designated SEQ ID:24846, to the nucleotide sequence of VGAM1078 RNA, herein designated VGAM RNA, also designated SEQ ID:3789.

[39352] Another function of VGAM1078 is therefore inhibition of FLJ23071 (Accession NM_025192). Accordingly, utilities of VGAM1078 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23071. Hydroxysteroid (17-beta) Dehydrogenase 12 (HSD17B12, Accession NM_016142) is another VGAM1078 host target gene. HSD17B12 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HSD17B12, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSD17B12 BINDING SITE, designated SEQ ID:18225, to the nucleotide sequence of VGAM1078 RNA, herein designated VGAM RNA, also designated SEQ ID:3789.

[39353] Another function of VGAM1078 is therefore inhibition of Hydroxysteroid (17-beta) Dehydrogenase 12 (HSD17B12, Accession NM_016142). Accordingly, utilities of VGAM1078 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with HSD17B12. HT002 (Accession NM_014066) is another VGAM1078 host target gene. HT002 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HT002, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HT002 BINDING SITE, designated SEQ ID:15282, to the nucleotide sequence of VGAM1078 RNA, herein designated VGAM RNA, also designated SEQ ID:3789.

[39354] Another function of VGAM1078 is therefore inhibition of HT002 (Accession NM_014066). Accordingly, utilities of VGAM1078 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HT002. KIAA0061 (Accession XM_043094) is another VGAM1078 host target gene. KIAA0061 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0061, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0061 BINDING SITE, designated SEQ ID:33891, to the nucleotide sequence of

VGAM1078 RNA, herein designated VGAM RNA, also designated SEQ ID:3789.

[39355] Another function of VGAM1078 is therefore inhibition of KIAA0061 (Accession XM_043094). Accordingly, utilities of VGAM1078 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0061. KIAA0252 (Accession XM_031646) is another VGAM1078 host target gene. KIAA0252 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0252, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0252 BINDING SITE, designated SEQ ID:31447, to the nucleotide sequence of VGAM1078 RNA, herein designated VGAM RNA, also designated SEQ ID:3789.

[39356] Another function of VGAM1078 is therefore inhibition of KIAA0252 (Accession XM_031646). Accordingly, utilities of VGAM1078 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0252. KIAA0729 (Accession XM_171027) is another VGAM1078 host target gene. KIAA0729 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by KIAA0729, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0729 BINDING SITE, designated SEQ ID:45804, to the nucleotide sequence of VGAM1078 RNA, herein designated VGAM RNA, also designated SEQ ID:3789.

[39357] Another function of VGAM1078 is therefore inhibition of KIAA0729 (Accession XM_171027). Accordingly, utilities of VGAM1078 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0729. Lipase, Endothelial (LIPG, Accession NM_006033) is another VGAM1078 host target gene. LIPG BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LIPG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LIPG BINDING SITE, designated SEQ ID:12653, to the nucleotide sequence of VGAM1078 RNA, herein designated VGAM RNA, also designated SEQ ID:3789.

[39358] Another function of VGAM1078 is therefore inhibition of Lipase, Endothelial (LIPG, Accession NM_006033). Accord-

ingly, utilities of VGAM1078 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LIPG. Synaptopodin 2 (SYNPO2, Accession XM_050219) is another VGAM1078 host target gene. SYNPO2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SYNPO2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SYNPO2 BINDING SITE, designated SEQ ID:35592, to the nucleotide sequence of VGAM1078 RNA, herein designated VGAM RNA, also designated SEQ ID:3789.

[39359] Another function of VGAM1078 is therefore inhibition of Synaptopodin 2 (SYNPO2, Accession XM_050219). Accordingly, utilities of VGAM1078 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SYNPO2. TBLR1 (Accession NM_024665) is another VGAM1078 host target gene. TBLR1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TBLR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of TBLR1 BINDING SITE, designated SEQ ID:23964, to the nucleotide sequence of VGAM1078 RNA, herein designated VGAM RNA, also designated SEQ ID:3789.

[39360] Another function of VGAM1078 is therefore inhibition of TBLR1 (Accession NM_024665). Accordingly, utilities of VGAM1078 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TBLR1. Zinc Finger Protein 300 (ZNF300, Accession NM_052860) is another VGAM1078 host target gene. ZNF300 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ZNF300, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF300 BINDING SITE, designated SEQ ID:27439, to the nucleotide sequence of VGAM1078 RNA, herein designated VGAM RNA, also designated SEQ ID:3789.

[39361] Another function of VGAM1078 is therefore inhibition of Zinc Finger Protein 300 (ZNF300, Accession NM_052860). Accordingly, utilities of VGAM1078 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF300. LOC145757 (Accession

XM_085227) is another VGAM1078 host target gene.

LOC145757 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC145757, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145757 BINDING SITE, designated SEQ ID:37968, to the nucleotide sequence of VGAM1078 RNA, herein designated VGAM RNA, also designated SEQ ID:3789.

[39362] Another function of VGAM1078 is therefore inhibition of LOC145757 (Accession XM_085227). Accordingly, utilities of VGAM1078 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145757. LOC145945 (Accession XM_096908) is another VGAM1078 host target gene. LOC145945 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC145945, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145945 BINDING SITE, designated SEQ ID:40629, to the nucleotide sequence of VGAM1078 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3789.

[39363] Another function of VGAM1078 is therefore inhibition of LOC145945 (Accession XM_096908). Accordingly, utilities of VGAM1078 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145945. LOC152190 (Accession XM_045692) is another VGAM1078 host target gene. LOC152190 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC152190, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152190 BINDING SITE, designated SEQ ID:34524, to the nucleotide sequence of VGAM1078 RNA, herein designated VGAM RNA, also designated SEQ ID:3789.

[39364] Another function of VGAM1078 is therefore inhibition of LOC152190 (Accession XM_045692). Accordingly, utilities of VGAM1078 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152190. LOC201164 (Accession XM_113904) is another VGAM1078 host target gene. LOC201164 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC201164, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201164 BINDING SITE, designated SEQ ID:42528, to the nucleotide sequence of VGAM1078 RNA, herein designated VGAM RNA, also designated SEQ ID:3789.

[39365] Another function of VGAM1078 is therefore inhibition of LOC201164 (Accession XM_113904). Accordingly, utilities of VGAM1078 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201164. LOC219899 (Accession XM_166173) is another VGAM1078 host target gene. LOC219899 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC219899, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219899 BINDING SITE, designated SEQ ID:43988, to the nucleotide sequence of VGAM1078 RNA, herein designated VGAM RNA, also designated SEQ ID:3789.

[39366] Another function of VGAM1078 is therefore inhibition of LOC219899 (Accession XM_166173). Accordingly, utilities of VGAM1078 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC219899. LOC220883 (Accession XM_166076) is another VGAM1078 host target gene. LOC220883 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC220883, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220883 BINDING SITE, designated SEQ ID:43848, to the nucleotide sequence of VGAM1078 RNA, herein designated VGAM RNA, also designated SEQ ID:3789.

[39367] Another function of VGAM1078 is therefore inhibition of LOC220883 (Accession XM_166076). Accordingly, utilities of VGAM1078 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220883. LOC255520 (Accession XM_171073) is another VGAM1078 host target gene. LOC255520 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC255520, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255520 BINDING SITE, designated SEQ ID:45877, to

the nucleotide sequence of VGAM1078 RNA, herein designated VGAM RNA, also designated SEQ ID:3789.

[39368] Another function of VGAM1078 is therefore inhibition of LOC255520 (Accession XM_171073). Accordingly, utilities of VGAM1078 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255520. LOC255919 (Accession XM_170794) is another VGAM1078 host target gene. LOC255919 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC255919, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255919 BINDING SITE, designated SEQ ID:45556, to the nucleotide sequence of VGAM1078 RNA, herein designated VGAM RNA, also designated SEQ ID:3789.

[39369] Another function of VGAM1078 is therefore inhibition of LOC255919 (Accession XM_170794). Accordingly, utilities of VGAM1078 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255919. LOC257355 (Accession XM_170482) is another VGAM1078 host target gene. LOC257355 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC257355, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257355 BINDING SITE, designated SEQ ID:45321, to the nucleotide sequence of VGAM1078 RNA, herein designated VGAM RNA, also designated SEQ ID:3789.

[39370] Another function of VGAM1078 is therefore inhibition of LOC257355 (Accession XM_170482). Accordingly, utilities of VGAM1078 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257355. LOC51172 (Accession XM_032690) is another VGAM1078 host target gene. LOC51172 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51172, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51172 BINDING SITE, designated SEQ ID:31720, to the nucleotide sequence of VGAM1078 RNA, herein designated VGAM RNA, also designated SEQ ID:3789.

[39371] Another function of VGAM1078 is therefore inhibition of LOC51172 (Accession XM_032690). Accordingly, utilities

of VGAM1078 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51172. LOC89231 (Accession XM_166577) is another VGAM1078 host target gene. LOC89231 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC89231, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC89231 BINDING SITE, designated SEQ ID:44550, to the nucleotide sequence of VGAM1078 RNA, herein designated VGAM RNA, also designated SEQ ID:3789.

[39372] Another function of VGAM1078 is therefore inhibition of LOC89231 (Accession XM_166577). Accordingly, utilities of VGAM1078 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC89231. LOC90639 (Accession XM_033092) is another VGAM1078 host target gene. LOC90639 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC90639, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

LOC90639 BINDING SITE, designated SEQ ID:31832, to the nucleotide sequence of VGAM1078 RNA, herein designated VGAM RNA, also designated SEQ ID:3789.

[39373] Another function of VGAM1078 is therefore inhibition of LOC90639 (Accession XM_033092). Accordingly, utilities of VGAM1078 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90639. LOC91565 (Accession XM_039231) is another VGAM1078 host target gene. LOC91565 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91565, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91565 BINDING SITE, designated SEQ ID:33022, to the nucleotide sequence of VGAM1078 RNA, herein designated VGAM RNA, also designated SEQ ID:3789.

[39374] Another function of VGAM1078 is therefore inhibition of LOC91565 (Accession XM_039231). Accordingly, utilities of VGAM1078 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91565. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 1079 (VGAM1079) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[39375] VGAM1079 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1079 was detected is described hereinabove with reference to Figs. 1–8.

[39376] VGAM1079 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Porcine Epidemic Diarrhea Virus. VGAM1079 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[39377] VGAM1079 gene encodes a VGAM1079 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1079 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1079 precursor RNA is designated SEQ ID:1065, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1065 is located at position 5967 relative to the

genome of Porcine Epidemic Diarrhea Virus.

[39378] VGAM1079 precursor RNA folds onto itself, forming VGAM1079 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[39379] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1079 folded precursor RNA into VGAM1079 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 50%) nucleotide sequence of VGAM1079 RNA is designated SEQ ID:3790, and is provided hereinbelow with reference to the sequence listing part.

[39380] VGAM1079 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM1079 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1079 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[39381] VGAM1079 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1079 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1079 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1079 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1079 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[39382] The complementary binding of VGAM1079 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1079 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1079 host target RNA into VGAM1079 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[39383] It is appreciated that VGAM1079 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1079 host target genes. The mRNA of each one of this plurality of VGAM1079 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1079 RNA, herein designated VGAM RNA, and which when bound by VGAM1079 RNA causes inhibition of translation of respective one or more VGAM1079 host target proteins.

[39384] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1079 gene, herein designated VGAM GENE, on one or more VGAM1079 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[39385] It is yet further appreciated that a function of VGAM1079 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1079 include diagnosis, prevention and treatment of viral infection by Porcine Epidemic Diarrhea Virus. Specific functions, and accordingly utilities, of

VGAM1079 correlate with, and may be deduced from, the identity of the host target genes which VGAM1079 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[39386] Nucleotide sequences of the VGAM1079 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1079 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1079 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1079 are further described hereinbelow with reference to Table 1.

[39387] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1079 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1079 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[39388] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1079 gene, herein designated VGAM is inhibition of expression of VGAM1079 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1079 correlate with, and may be deduced

from, the identity of the target genes which VGAM1079 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[39389] CGTHBA (Accession NM_012075) is a VGAM1079 host target gene. CGTHBA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CGTHBA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CGTHBA BINDING SITE, designated SEQ ID:14363, to the nucleotide sequence of VGAM1079 RNA, herein designated VGAM RNA, also designated SEQ ID:3790.

[39390] A function of VGAM1079 is therefore inhibition of CGTHBA (Accession NM_012075). Accordingly, utilities of VGAM1079 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CGTHBA. Chloride Channel 6 (CLCN6, Accession NM_021735) is another VGAM1079 host target gene. CLCN6 BINDING SITE1 through CLCN6 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by CLCN6, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING

SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLCN6 BINDING SITE1 through CLCN6 BINDING SITE3, designated SEQ ID:22336, SEQ ID:6959 and SEQ ID:22341 respectively, to the nucleotide sequence of VGAM1079 RNA, herein designated VGAM RNA, also designated SEQ ID:3790.

[39391] Another function of VGAM1079 is therefore inhibition of Chloride Channel 6 (CLCN6, Accession NM_021735), a gene which is a voltage-gated chloride channel. Accordingly, utilities of VGAM1079 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLCN6. The function of CLCN6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM599.LBP-9 (Accession NM_014553) is another VGAM1079 host target gene. LBP-9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LBP-9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LBP-9 BINDING SITE, designated SEQ ID:15873, to the nucleotide sequence of VGAM1079 RNA, herein designated

VGAM RNA, also designated SEQ ID:3790.

[39392] Another function of VGAM1079 is therefore inhibition of LBP-9 (Accession NM_014553). Accordingly, utilities of VGAM1079 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LBP-9. Mitochondrial Ribosomal Protein L10 (MRPL10, Accession NM_145255) is another VGAM1079 host target gene. MRPL10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MRPL10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MRPL10 BINDING SITE, designated SEQ ID:29767, to the nucleotide sequence of VGAM1079 RNA, herein designated VGAM RNA, also designated SEQ ID:3790.

[39393] Another function of VGAM1079 is therefore inhibition of Mitochondrial Ribosomal Protein L10 (MRPL10, Accession NM_145255). Accordingly, utilities of VGAM1079 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MRPL10. LOC202126 (Accession XM_117362) is another VGAM1079 host target gene. LOC202126 BINDING SITE is HOST TARGET binding

site found in the 3' untranslated region of mRNA encoded by LOC202126, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC202126 BINDING SITE, designated SEQ ID:43411, to the nucleotide sequence of VGAM1079 RNA, herein designated VGAM RNA, also designated SEQ ID:3790.

[39394] Another function of VGAM1079 is therefore inhibition of LOC202126 (Accession XM_117362). Accordingly, utilities of VGAM1079 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC202126. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1080 (VGAM1080) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[39395] VGAM1080 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1080 was detected is described hereinabove with reference to Figs. 1-8.

[39396] VGAM1080 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Porcine Epidemic Diarrhea Virus. VGAM1080 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[39397] VGAM1080 gene encodes a VGAM1080 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1080 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1080 precursor RNA is designated SEQ ID:1066, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1066 is located at position 15169 relative to the genome of Porcine Epidemic Diarrhea Virus.

[39398] VGAM1080 precursor RNA folds onto itself, forming VGAM1080 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence

of the nucleotide sequence of the second half thereof.

[39399] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1080 folded precursor RNA into VGAM1080 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 57%) nucleotide sequence of VGAM1080 RNA is designated SEQ ID:3791, and is provided hereinbelow with reference to the sequence listing part.

[39400] VGAM1080 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1080 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1080 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[39401] VGAM1080 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1080 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1080 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1080 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1080 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[39402] The complementary binding of VGAM1080 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1080 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM1080 host target RNA into VGAM1080 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[39403] It is appreciated that VGAM1080 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1080 host target genes. The mRNA of each one of this plurality of VGAM1080 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1080 RNA, herein designated VGAM RNA, and which when bound by VGAM1080 RNA causes inhibition of translation of respective one or more VGAM1080 host target proteins.

[39404] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1080 gene, herein designated VGAM GENE, on one or more VGAM1080 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[39405] It is yet further appreciated that a function of VGAM1080 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1080 include diagnosis, prevention and treatment of viral infection by Porcine Epidemic Diarrhea Virus. Specific functions, and accordingly utilities, of VGAM1080 correlate with, and may be deduced from, the identity of the host target genes which VGAM1080 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[39406] Nucleotide sequences of the VGAM1080 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1080 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1080 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM1080 are further described hereinbelow with reference to Table 1.

[39407] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1080 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1080 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[39408] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1080 gene, herein designated VGAM is inhibition of expression of VGAM1080 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1080 correlate with, and may be deduced from, the identity of the target genes which VGAM1080 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[39409] UDP-N-acetyl-alpha-D-galactosamine:polypeptide N-acetylgalactosaminyltransferase 1 (GalNAc-T1) (GALNT1, Accession NM_020474) is a VGAM1080 host target gene. GALNT1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GALNT1, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GALNT1 BINDING SITE, designated SEQ ID:21726, to the nucleotide sequence of VGAM1080 RNA, herein designated VGAM RNA, also designated SEQ ID:3791.

[39410] A function of VGAM1080 is therefore inhibition of UDP-N-acetyl-alpha-D-galactosamine:polypeptide N-acetylgalactosaminyltransferase 1 (GalNAc-T1) (GALNT1, Accession NM_020474), a gene which transfers an N-acetyl galactosamine (GalNAc) to a serine or threonine residue in the first step of O-linked oligosaccharide biosynthesis. Accordingly, utilities of VGAM1080 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GALNT1. The function of GALNT1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM120. Cytoskeleton-associated Protein 4 (CKAP4, Accession NM_006825) is another VGAM1080 host target gene. CKAP4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CKAP4, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CKAP4 BINDING SITE, designated SEQ ID:13706, to the nucleotide sequence of VGAM1080 RNA, herein designated VGAM RNA, also designated SEQ ID:3791.

[39411] Another function of VGAM1080 is therefore inhibition of Cytoskeleton-associated Protein 4 (CKAP4, Accession NM_006825). Accordingly, utilities of VGAM1080 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CKAP4. FLJ13081 (Accession NM_024834) is another VGAM1080 host target gene. FLJ13081 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13081, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13081 BINDING SITE, designated SEQ ID:24238, to the nucleotide sequence of VGAM1080 RNA, herein designated VGAM RNA, also designated SEQ ID:3791.

[39412] Another function of VGAM1080 is therefore inhibition of FLJ13081 (Accession NM_024834). Accordingly, utilities of

VGAM1080 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13081. FLJ23024 (Accession NM_024936) is another VGAM1080 host target gene. FLJ23024 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ23024, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23024 BINDING SITE, designated SEQ ID:24475, to the nucleotide sequence of VGAM1080 RNA, herein designated VGAM RNA, also designated SEQ ID:3791.

[39413] Another function of VGAM1080 is therefore inhibition of FLJ23024 (Accession NM_024936). Accordingly, utilities of VGAM1080 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23024. KIAA0121 (Accession XM_052386) is another VGAM1080 host target gene. KIAA0121 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA0121, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA0121 BINDING SITE, designated SEQ ID:35971, to the nucleotide sequence of VGAM1080 RNA, herein designated VGAM RNA, also designated SEQ ID:3791.

[39414] Another function of VGAM1080 is therefore inhibition of KIAA0121 (Accession XM_052386). Accordingly, utilities of VGAM1080 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0121. Sema Domain, Immunoglobulin Domain (Ig), Short Basic Domain, Secreted, (semaphorin) 3C (SEMA3C, Accession NM_006379) is another VGAM1080 host target gene. SEMA3C BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SEMA3C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEMA3C BINDING SITE, designated SEQ ID:13076, to the nucleotide sequence of VGAM1080 RNA, herein designated VGAM RNA, also designated SEQ ID:3791.

[39415] Another function of VGAM1080 is therefore inhibition of Sema Domain, Immunoglobulin Domain (Ig), Short Basic Domain, Secreted, (semaphorin) 3C (SEMA3C, Accession NM_006379). Accordingly, utilities of VGAM1080 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with SEMA3C. Solute Carrier Family 26, Member 7 (SLC26A7, Accession NM_052832) is another VGAM1080 host target gene. SLC26A7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC26A7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC26A7 BINDING SITE, designated SEQ ID:27415, to the nucleotide sequence of VGAM1080 RNA, herein designated VGAM RNA, also designated SEQ ID:3791.

[39416] Another function of VGAM1080 is therefore inhibition of Solute Carrier Family 26, Member 7 (SLC26A7, Accession NM_052832). Accordingly, utilities of VGAM1080 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC26A7. Serine Palmitoyltransferase, Long Chain Base Subunit 2 (SPTLC2, Accession NM_004863) is another VGAM1080 host target gene. SPTLC2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SPTLC2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of SPTLC2 BINDING SITE, designated SEQ ID:11284, to the nucleotide sequence of VGAM1080 RNA, herein designated VGAM RNA, also designated SEQ ID:3791.

[39417] Another function of VGAM1080 is therefore inhibition of Serine Palmitoyltransferase, Long Chain Base Subunit 2 (SPTLC2, Accession NM_004863). Accordingly, utilities of VGAM1080 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SPTLC2. LOC145748 (Accession XM_096853) is another VGAM1080 host target gene. LOC145748 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145748, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145748 BINDING SITE, designated SEQ ID:40580, to the nucleotide sequence of VGAM1080 RNA, herein designated VGAM RNA, also designated SEQ ID:3791.

[39418] Another function of VGAM1080 is therefore inhibition of LOC145748 (Accession XM_096853). Accordingly, utilities of VGAM1080 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC145748. LOC91145 (Accession XM_036454) is another VGAM1080 host target gene. LOC91145 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC91145, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91145 BINDING SITE, designated SEQ ID:32450, to the nucleotide sequence of VGAM1080 RNA, herein designated VGAM RNA, also designated SEQ ID:3791.

[39419] Another function of VGAM1080 is therefore inhibition of LOC91145 (Accession XM_036454). Accordingly, utilities of VGAM1080 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91145. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1081 (VGAM1081) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[39420] VGAM1081 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1081 was detected is described hereinabove with reference to Figs. 1–8.

[39421] VGAM1081 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Porcine Epidemic Diarrhea Virus. VGAM1081 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[39422] VGAM1081 gene encodes a VGAM1081 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1081 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1081 precursor RNA is designated SEQ ID:1067, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1067 is located at position 11817 relative to the genome of Porcine Epidemic Diarrhea Virus.

[39423] VGAM1081 precursor RNA folds onto itself, forming VGAM1081 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by

miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[39424] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1081 folded precursor RNA into VGAM1081 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of VGAM1081 RNA is designated SEQ ID:3792, and is provided hereinbelow with reference to the sequence listing part.

[39425] VGAM1081 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1081 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1081 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[39426] VGAM1081 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1081 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1081 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1081 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1081 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[39427] The complementary binding of VGAM1081 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM1081 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1081 host target RNA into VGAM1081 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[39428] It is appreciated that VGAM1081 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1081 host target genes. The mRNA of each one of this plurality of VGAM1081 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1081 RNA, herein designated VGAM RNA, and which when bound by VGAM1081 RNA causes inhibition of translation of respective one or more VGAM1081 host target proteins.

[39429] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1081 gene, herein designated VGAM GENE, on one or more VGAM1081 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[39430] It is yet further appreciated that a function of VGAM1081 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1081 include diagnosis, prevention and treatment of viral infection by Porcine Epidemic Diarrhea Virus. Specific functions, and accordingly utilities, of VGAM1081 correlate with, and may be deduced from, the identity of the host target genes which VGAM1081 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[39431] Nucleotide sequences of the VGAM1081 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM1081 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1081 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1081 are further described hereinbelow with reference to Table 1.

[39432] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1081 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1081 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[39433] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1081 gene, herein designated VGAM is inhibition of expression of VGAM1081 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1081 correlate with, and may be deduced from, the identity of the target genes which VGAM1081 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[39434] Calpain 10 (CAPN10, Accession NM_023088) is a VGAM1081 host target gene. CAPN10 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by CAPN10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CAPN10 BINDING SITE, designated SEQ ID:23356, to the nucleotide sequence of VGAM1081 RNA, herein designated VGAM RNA, also designated SEQ ID:3792.

[39435] A function of VGAM1081 is therefore inhibition of Calpain 10 (CAPN10, Accession NM_023088), a gene which catalyzes limited proteolysis of substrates involved in cytoskeletal remodelling and signal transduction. Accordingly, utilities of VGAM1081 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAPN10. The function of CAPN10 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM247. Endoglin (Osler-Rendu-Weber syndrome 1) (ENG, Accession NM_000118) is another VGAM1081 host target gene. ENG BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ENG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of ENG BINDING SITE, designated SEQ ID:5591, to the nucleotide sequence of VGAM1081 RNA, herein designated VGAM RNA, also designated SEQ ID:3792.

[39436] Another function of VGAM1081 is therefore inhibition of Endoglin (Osler–Rendu–Weber syndrome 1) (ENG, Accession NM_000118). Accordingly, utilities of VGAM1081 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ENG. LARS2 (Accession NM_015340) is another VGAM1081 host target gene. LARS2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LARS2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LARS2 BINDING SITE, designated SEQ ID:17648, to the nucleotide sequence of VGAM1081 RNA, herein designated VGAM RNA, also designated SEQ ID:3792.

[39437] Another function of VGAM1081 is therefore inhibition of LARS2 (Accession NM_015340). Accordingly, utilities of VGAM1081 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LARS2.

Membrane Component, Chromosome 17, Surface Marker 2 (ovarian carcinoma antigen CA125) (M17S2, Accession NM_031858) is another VGAM1081 host target gene. M17S2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by M17S2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of M17S2 BINDING SITE, designated SEQ ID:25610, to the nucleotide sequence of VGAM1081 RNA, herein designated VGAM RNA, also designated SEQ ID:3792.

[39438] Another function of VGAM1081 is therefore inhibition of Membrane Component, Chromosome 17, Surface Marker 2 (ovarian carcinoma antigen CA125) (M17S2, Accession NM_031858), a gene which Contains a B-box/coiled coil motif. Accordingly, utilities of VGAM1081 include diagnosis, prevention and treatment of diseases and clinical conditions associated with M17S2. The function of M17S2 has been established by previous studies. In an attempt to clone the CA125 gene (OMIM Ref. No. 606154), Campbell et al. (1994) isolated a cDNA from an expression library that mapped close to the BRCA1 locus (OMIM Ref. No.

113705) at 17q21.1. Closer investigation showed that it was within the smallest known region containing the BRCA1 gene. The predicted 966–amino acid polypeptide lacks the membrane protein characteristics expected for CA125 but does include a B–box/coiled coil motif present in many genes with transformation potential. Campbell et al. (1994) used fluorescence in situ hybridization to demonstrate mapping within the BRCA1 minimum region. YAC and cosmid clones were isolated and used to refine the location of this gene adjacent and proximal to the RNU2 locus (OMIM Ref. No. 180690). The exon structure of the gene was also determined. Extensive SSCP and sequence analysis of over 100 tumor and normal DNAs from familial and sporadic breast cancers and sporadic ovarian cancers failed to detect mutations in the coding region of this gene. Brown et al. (1994), who referred to the gene as 1A1–3B, showed that the transcription start site of M17S2 is 295 bp distal from the initiation site of BRCA1 and that the gene is transcribed divergently from BRCA1. The authors speculated that M17S2 may be involved in the regulation of transcription or translation of BRCA1. Brown et al. (1996) described the genomic region that encompasses both the BRCA1 and M17S2 genes. They found a tandem

duplication of 30 kb that results in 2 copies of exons 1 and 2 of BRCA1 and exons 1 and 3 of M17S2.

[39439] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[39440] Brown, M. A.; Xu, C.-F.; Nicolai, H.; Griffiths, B.; Chambers, J. A.; Black, D.; Solomon, E. : The 5-prime end of the BRCA1 gene lies within a duplicated region of human chromosome 17q21. *Oncogene* 12: 2507-2513, 1996. ; and

[39441] Campbell, I. G.; Nicolai, H. M.; Foulkes, W. D.; Senger, G.; Stamp, G. W.; Allan, G.; Boyer, C.; Jones, K.; Bast, R. C., Jr.; Solomon, E.; Trowsdale, J.; Black, D. M. : A novel gene encoding.

[39442] Further studies establishing the function and utilities of M17S2 are found in John Hopkins OMIM database record ID 166945, and in cited publications numbered 1815-1817 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Mannan-binding Lectin Serine Protease 1 (C4/C2 activating component of Ra-reactive factor) (MASP1, Accession NM_001879) is another VGAM1081 host target gene. MASP1 BINDING SITE is HOST TARGET binding site found

in the 3' untranslated region of mRNA encoded by MASP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MASP1 BINDING SITE, designated SEQ ID:7608, to the nucleotide sequence of VGAM1081 RNA, herein designated VGAM RNA, also designated SEQ ID:3792.

[39443] Another function of VGAM1081 is therefore inhibition of Mannan-binding Lectin Serine Protease 1 (C4/C2 activating component of Ra-reactive factor) (MASP1, Accession NM_001879), a gene which a complement-dependent bactericidal factor . Accordingly, utilities of VGAM1081 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MASP1. The function of MASP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM566. Myeloid/lymphoid Or Mixed-lineage Leukemia (trithorax homolog, Drosophila); Translocated To, 2 (MLLT2, Accession NM_005935) is another VGAM1081 host target gene. MLLT2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA

encoded by MLLT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MLLT2 BINDING SITE, designated SEQ ID:12574, to the nucleotide sequence of VGAM1081 RNA, herein designated VGAM RNA, also designated SEQ ID:3792.

[39444] Another function of VGAM1081 is therefore inhibition of Myeloid/lymphoid Or Mixed-lineage Leukemia (trithorax homolog, Drosophila); Translocated To, 2 (MLLT2, Accession NM_005935), a gene which is a Putative transcription factor. Accordingly, utilities of VGAM1081 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MLLT2. The function of MLLT2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM57. MAX Binding Protein (MNT, Accession NM_020310) is another VGAM1081 host target gene. MNT BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MNT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of MNT BINDING SITE, designated SEQ ID:21567, to the nucleotide sequence of VGAM1081 RNA, herein designated VGAM RNA, also designated SEQ ID:3792.

[39445] Another function of VGAM1081 is therefore inhibition of MAX Binding Protein (MNT, Accession NM_020310). Accordingly, utilities of VGAM1081 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MNT. Mature T-cell Proliferation 1 (MTCP1, Accession NM_014221) is another VGAM1081 host target gene. MTCP1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MTCP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MTCP1 BINDING SITE, designated SEQ ID:15489, to the nucleotide sequence of VGAM1081 RNA, herein designated VGAM RNA, also designated SEQ ID:3792.

[39446] Another function of VGAM1081 is therefore inhibition of Mature T-cell Proliferation 1 (MTCP1, Accession NM_014221). Accordingly, utilities of VGAM1081 include diagnosis, prevention and treatment of diseases and clinical

cal conditions associated with MTCP1. Nuclear Receptor Coactivator 6 (NCOA6, Accession NM_014071) is another VGAM1081 host target gene. NCOA6 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by NCOA6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NCOA6 BINDING SITE, designated SEQ ID:15288, to the nucleotide sequence of VGAM1081 RNA, herein designated VGAM RNA, also designated SEQ ID:3792.

[39447] Another function of VGAM1081 is therefore inhibition of Nuclear Receptor Coactivator 6 (NCOA6, Accession NM_014071), a gene which activates gene transcription through ligand-dependent association with coactivators. Accordingly, utilities of VGAM1081 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NCOA6. The function of NCOA6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM25. Nuclear Factor Related to Kappa B Binding Protein (NFRKB, Accession NM_006165) is another VGAM1081 host target gene.

NFRKB BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by NFRKB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NFRKB BINDING SITE, designated SEQ ID:12823, to the nucleotide sequence of VGAM1081 RNA, herein designated VGAM RNA, also designated SEQ ID:3792.

[39448] Another function of VGAM1081 is therefore inhibition of Nuclear Factor Related to Kappa B Binding Protein (NFRKB, Accession NM_006165). Accordingly, utilities of VGAM1081 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NFRKB. Plexin A2 (PLXNA2, Accession NM_025179) is another VGAM1081 host target gene. PLXNA2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PLXNA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLXNA2 BINDING SITE, designated SEQ ID:24816, to the nucleotide sequence of VGAM1081 RNA, herein designated VGAM

RNA, also designated SEQ ID:3792.

[39449] Another function of VGAM1081 is therefore inhibition of Plexin A2 (PLXNA2, Accession NM_025179), a gene which is a transmembrane protein. Accordingly, utilities of VGAM1081 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLXNA2. The function of PLXNA2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM538. Syndecan 2 (heparan sulfate proteoglycan 1, cell surface-associated, fibroglycan) (SDC2, Accession XM_040582) is another VGAM1081 host target gene. SDC2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SDC2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SDC2 BINDING SITE, designated SEQ ID:33327, to the nucleotide sequence of VGAM1081 RNA, herein designated VGAM RNA, also designated SEQ ID:3792.

[39450] Another function of VGAM1081 is therefore inhibition of Syndecan 2 (heparan sulfate proteoglycan 1, cell surface-associated, fibroglycan) (SDC2, Accession XM_040582).

Accordingly, utilities of VGAM1081 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SDC2. Steroid Sulfatase (microsomal), Arylsulfatase C, Isozyme S (STS, Accession NM_000351) is another VGAM1081 host target gene. STS BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by STS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STS BINDING SITE, designated SEQ ID:5908, to the nucleotide sequence of VGAM1081 RNA, herein designated VGAM RNA, also designated SEQ ID:3792.

[39451] Another function of VGAM1081 is therefore inhibition of Steroid Sulfatase (microsomal), Arylsulfatase C, Isozyme S (STS, Accession NM_000351). Accordingly, utilities of VGAM1081 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STS. Transcription Factor 2, Hepatic; LF-B3; Variant Hepatic Nuclear Factor (TCF2, Accession NM_006481) is another VGAM1081 host target gene. TCF2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TCF2, corresponding to a HOST

TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TCF2 BINDING SITE, designated SEQ ID:13203, to the nucleotide sequence of VGAM1081 RNA, herein designated VGAM RNA, also designated SEQ ID:3792.

[39452] Another function of VGAM1081 is therefore inhibition of Transcription Factor 2, Hepatic; LF-B3; Variant Hepatic Nuclear Factor (TCF2, Accession NM_006481), a gene which probably binds to the inverted palindrome 5'-gttaatnattaac-3'. Accordingly, utilities of VGAM1081 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TCF2. The function of TCF2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM118.T-cell Leukemia Translocation Altered Gene (TCTA, Accession NM_022171) is another VGAM1081 host target gene. TCTA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TCTA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of TCTA BINDING SITE, designated SEQ ID:22732, to the nucleotide sequence of VGAM1081 RNA, herein designated VGAM RNA, also designated SEQ ID:3792.

[39453] Another function of VGAM1081 is therefore inhibition of T-cell Leukemia Translocation Altered Gene (TCTA, Accession NM_022171). Accordingly, utilities of VGAM1081 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TCTA. Chromosome 20 Open Reading Frame 110 (C20orf110, Accession XM_086728) is another VGAM1081 host target gene. C20orf110 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C20orf110, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf110 BINDING SITE, designated SEQ ID:38839, to the nucleotide sequence of VGAM1081 RNA, herein designated VGAM RNA, also designated SEQ ID:3792.

[39454] Another function of VGAM1081 is therefore inhibition of Chromosome 20 Open Reading Frame 110 (C20orf110, Accession XM_086728). Accordingly, utilities of

VGAM1081 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf110. Chromosome 20 Open Reading Frame 42 (C20orf42, Accession NM_017671) is another VGAM1081 host target gene. C20orf42 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C20orf42, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf42 BINDING SITE, designated SEQ ID:19216, to the nucleotide sequence of VGAM1081 RNA, herein designated VGAM RNA, also designated SEQ ID:3792.

[39455] Another function of VGAM1081 is therefore inhibition of Chromosome 20 Open Reading Frame 42 (C20orf42, Accession NM_017671). Accordingly, utilities of VGAM1081 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf42. Diacylglycerol Kinase, Zeta 104kDa (DGKZ, Accession NM_003646) is another VGAM1081 host target gene. DGKZ BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DGKZ, corresponding to a HOST TARGET binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DGKZ BINDING SITE, designated SEQ ID:9722, to the nucleotide sequence of VGAM1081 RNA, herein designated VGAM RNA, also designated SEQ ID:3792.

[39456] Another function of VGAM1081 is therefore inhibition of Diacylglycerol Kinase, Zeta 104kDa (DGKZ, Accession NM_003646). Accordingly, utilities of VGAM1081 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DGKZ. FLJ10097 (Accession XM_043653) is another VGAM1081 host target gene. FLJ10097 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10097, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10097 BINDING SITE, designated SEQ ID:33989, to the nucleotide sequence of VGAM1081 RNA, herein designated VGAM RNA, also designated SEQ ID:3792.

[39457] Another function of VGAM1081 is therefore inhibition of FLJ10097 (Accession XM_043653). Accordingly, utilities of VGAM1081 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ10097. FLJ20686 (Accession NM_017925) is another VGAM1081 host target gene. FLJ20686 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20686, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20686 BINDING SITE, designated SEQ ID:19597, to the nucleotide sequence of VGAM1081 RNA, herein designated VGAM RNA, also designated SEQ ID:3792.

[39458] Another function of VGAM1081 is therefore inhibition of FLJ20686 (Accession NM_017925). Accordingly, utilities of VGAM1081 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20686. Golgi Autoantigen, Golgin Subfamily A, 1 (GOLGA1, Accession NM_002077) is another VGAM1081 host target gene. GOLGA1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GOLGA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GOLGA1 BINDING SITE,

designated SEQ ID:7865, to the nucleotide sequence of VGAM1081 RNA, herein designated VGAM RNA, also designated SEQ ID:3792.

[39459] Another function of VGAM1081 is therefore inhibition of Golgi Autoantigen, Golgin Subfamily A, 1 (GOLGA1, Accession NM_002077). Accordingly, utilities of VGAM1081 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GOLGA1. Potassium Channel, Subfamily V, Member 1 (KCNV1, Accession NM_014379) is another VGAM1081 host target gene. KCNV1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KCNV1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNV1 BINDING SITE, designated SEQ ID:15713, to the nucleotide sequence of VGAM1081 RNA, herein designated VGAM RNA, also designated SEQ ID:3792.

[39460] Another function of VGAM1081 is therefore inhibition of Potassium Channel, Subfamily V, Member 1 (KCNV1, Accession NM_014379). Accordingly, utilities of VGAM1081 include diagnosis, prevention and treatment of diseases

and clinical conditions associated with KCNV1. LAT1-3TM (Accession NM_031211) is another VGAM1081 host target gene. LAT1-3TM BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LAT1-3TM, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LAT1-3TM BINDING SITE, designated SEQ ID:25252, to the nucleotide sequence of VGAM1081 RNA, herein designated VGAM RNA, also designated SEQ ID:3792.

[39461] Another function of VGAM1081 is therefore inhibition of LAT1-3TM (Accession NM_031211). Accordingly, utilities of VGAM1081 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LAT1-3TM. MCF.2 Cell Line Derived Transforming Sequence-like (MCF2L, Accession XM_027516) is another VGAM1081 host target gene. MCF2L BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MCF2L, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MCF2L BINDING SITE,

designated SEQ ID:30510, to the nucleotide sequence of VGAM1081 RNA, herein designated VGAM RNA, also designated SEQ ID:3792.

[39462] Another function of VGAM1081 is therefore inhibition of MCF.2 Cell Line Derived Transforming Sequence-like (MCF2L, Accession XM_027516). Accordingly, utilities of VGAM1081 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MCF2L. MGC5601 (Accession NM_025247) is another VGAM1081 host target gene. MGC5601 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC5601, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC5601 BINDING SITE, designated SEQ ID:24927, to the nucleotide sequence of VGAM1081 RNA, herein designated VGAM RNA, also designated SEQ ID:3792.

[39463] Another function of VGAM1081 is therefore inhibition of MGC5601 (Accession NM_025247). Accordingly, utilities of VGAM1081 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC5601. NBR2 (Accession NM_005821) is another

VGAM1081 host target gene. NBR2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by NBR2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NBR2 BINDING SITE, designated SEQ ID:12426, to the nucleotide sequence of VGAM1081 RNA, herein designated VGAM RNA, also designated SEQ ID:3792.

[39464] Another function of VGAM1081 is therefore inhibition of NBR2 (Accession NM_005821). Accordingly, utilities of VGAM1081 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NBR2. Phosphatidylethanolamine N-methyltransferase (PEMT, Accession NM_007169) is another VGAM1081 host target gene. PEMT BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PEMT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PEMT BINDING SITE, designated SEQ ID:14014, to the nucleotide sequence of VGAM1081 RNA, herein designated VGAM RNA, also designated SEQ ID:3792.

[39465] Another function of VGAM1081 is therefore inhibition of Phosphatidylethanolamine N-methyltransferase (PEMT, Accession NM_007169). Accordingly, utilities of VGAM1081 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PEMT. Protein Phosphatase 2 (formerly 2A), Regulatory Subunit B", Alpha (PPP2R3A, Accession NM_002718) is another VGAM1081 host target gene. PPP2R3A BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PPP2R3A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP2R3A BINDING SITE, designated SEQ ID:8586, to the nucleotide sequence of VGAM1081 RNA, herein designated VGAM RNA, also designated SEQ ID:3792.

[39466] Another function of VGAM1081 is therefore inhibition of Protein Phosphatase 2 (formerly 2A), Regulatory Subunit B", Alpha (PPP2R3A, Accession NM_002718). Accordingly, utilities of VGAM1081 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP2R3A. LOC119188 (Accession XM_058373) is another VGAM1081 host target gene. LOC119188 BINDING

SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC119188, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC119188 BINDING SITE, designated SEQ ID:36612, to the nucleotide sequence of VGAM1081 RNA, herein designated VGAM RNA, also designated SEQ ID:3792.

[39467] Another function of VGAM1081 is therefore inhibition of LOC119188 (Accession XM_058373). Accordingly, utilities of VGAM1081 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC119188. LOC143153 (Accession XM_084440) is another VGAM1081 host target gene. LOC143153 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC143153, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143153 BINDING SITE, designated SEQ ID:37579, to the nucleotide sequence of VGAM1081 RNA, herein designated VGAM RNA, also designated SEQ ID:3792.

[39468] Another function of VGAM1081 is therefore inhibition of

LOC143153 (Accession XM_084440). Accordingly, utilities of VGAM1081 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143153. LOC143154 (Accession XM_084441) is another VGAM1081 host target gene. LOC143154 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC143154, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143154 BINDING SITE, designated SEQ ID:37586, to the nucleotide sequence of VGAM1081 RNA, herein designated VGAM RNA, also designated SEQ ID:3792.

[39469] Another function of VGAM1081 is therefore inhibition of LOC143154 (Accession XM_084441). Accordingly, utilities of VGAM1081 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143154. LOC148195 (Accession XM_097419) is another VGAM1081 host target gene. LOC148195 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC148195, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC148195 BINDING SITE, designated SEQ ID:40874, to the nucleotide sequence of VGAM1081 RNA, herein designated VGAM RNA, also designated SEQ ID:3792.

[39470] Another function of VGAM1081 is therefore inhibition of LOC148195 (Accession XM_097419). Accordingly, utilities of VGAM1081 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148195. LOC149010 (Accession XM_086397) is another VGAM1081 host target gene. LOC149010 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149010, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149010 BINDING SITE, designated SEQ ID:38630, to the nucleotide sequence of VGAM1081 RNA, herein designated VGAM RNA, also designated SEQ ID:3792.

[39471] Another function of VGAM1081 is therefore inhibition of LOC149010 (Accession XM_086397). Accordingly, utilities of VGAM1081 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149010. LOC149182 (Accession XM_097605) is an-

other VGAM1081 host target gene. LOC149182 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC149182, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149182 BINDING SITE, designated SEQ ID:40970, to the nucleotide sequence of VGAM1081 RNA, herein designated VGAM RNA, also designated SEQ ID:3792.

[39472] Another function of VGAM1081 is therefore inhibition of LOC149182 (Accession XM_097605). Accordingly, utilities of VGAM1081 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149182. LOC150159 (Accession NM_139173) is another VGAM1081 host target gene. LOC150159 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150159, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150159 BINDING SITE, designated SEQ ID:29180, to the nucleotide sequence of VGAM1081 RNA, herein designated VGAM RNA, also designated SEQ ID:3792.

[39473] Another function of VGAM1081 is therefore inhibition of LOC150159 (Accession NM_139173). Accordingly, utilities of VGAM1081 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150159. LOC197423 (Accession XM_085436) is another VGAM1081 host target gene. LOC197423 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC197423, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC197423 BINDING SITE, designated SEQ ID:38142, to the nucleotide sequence of VGAM1081 RNA, herein designated VGAM RNA, also designated SEQ ID:3792.

[39474] Another function of VGAM1081 is therefore inhibition of LOC197423 (Accession XM_085436). Accordingly, utilities of VGAM1081 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197423. LOC200597 (Accession XM_114266) is another VGAM1081 host target gene. LOC200597 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC200597, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200597 BINDING SITE, designated SEQ ID:42826, to the nucleotide sequence of VGAM1081 RNA, herein designated VGAM RNA, also designated SEQ ID:3792.

[39475] Another function of VGAM1081 is therefore inhibition of LOC200597 (Accession XM_114266). Accordingly, utilities of VGAM1081 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200597. LOC204970 (Accession XM_114795) is another VGAM1081 host target gene. LOC204970 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC204970, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC204970 BINDING SITE, designated SEQ ID:43069, to the nucleotide sequence of VGAM1081 RNA, herein designated VGAM RNA, also designated SEQ ID:3792.

[39476] Another function of VGAM1081 is therefore inhibition of LOC204970 (Accession XM_114795). Accordingly, utilities of VGAM1081 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC204970. LOC219294 (Accession XM_167566) is another VGAM1081 host target gene. LOC219294 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC219294, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219294 BINDING SITE, designated SEQ ID:44686, to the nucleotide sequence of VGAM1081 RNA, herein designated VGAM RNA, also designated SEQ ID:3792.

[39477] Another function of VGAM1081 is therefore inhibition of LOC219294 (Accession XM_167566). Accordingly, utilities of VGAM1081 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219294. LOC219295 (Accession XM_167565) is another VGAM1081 host target gene. LOC219295 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC219295, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219295 BINDING SITE, designated SEQ ID:44681, to the nucleotide sequence of VGAM1081 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3792.

[39478] Another function of VGAM1081 is therefore inhibition of LOC219295 (Accession XM_167565). Accordingly, utilities of VGAM1081 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219295. LOC219513 (Accession XM_169166) is another VGAM1081 host target gene. LOC219513 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC219513, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219513 BINDING SITE, designated SEQ ID:45296, to the nucleotide sequence of VGAM1081 RNA, herein designated VGAM RNA, also designated SEQ ID:3792.

[39479] Another function of VGAM1081 is therefore inhibition of LOC219513 (Accession XM_169166). Accordingly, utilities of VGAM1081 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219513. LOC221641 (Accession XM_168090) is another VGAM1081 host target gene. LOC221641 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC221641, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221641 BINDING SITE, designated SEQ ID:45009, to the nucleotide sequence of VGAM1081 RNA, herein designated VGAM RNA, also designated SEQ ID:3792.

[39480] Another function of VGAM1081 is therefore inhibition of LOC221641 (Accession XM_168090). Accordingly, utilities of VGAM1081 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221641. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1082 (VGAM1082) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[39481] VGAM1082 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1082 was detected is described hereinabove with reference to Figs. 1-8.

[39482] VGAM1082 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Porcine Epidemic Diar-

rhea Virus. VGAM1082 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[39483] VGAM1082 gene encodes a VGAM1082 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1082 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1082 precursor RNA is designated SEQ ID:1068, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1068 is located at position 15710 relative to the genome of Porcine Epidemic Diarrhea Virus.

[39484] VGAM1082 precursor RNA folds onto itself, forming VGAM1082 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[39485] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM1082 folded precursor RNA into VGAM1082 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1082 RNA is designated SEQ ID:3793, and is provided hereinbelow with reference to the sequence listing part.

[39486] VGAM1082 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1082 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1082 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[39487] VGAM1082 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1082 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM1082 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1082 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1082 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[39488] The complementary binding of VGAM1082 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1082 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1082 host target RNA into VGAM1082 host target protein,

herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[39489] It is appreciated that VGAM1082 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1082 host target genes. The mRNA of each one of this plurality of VGAM1082 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1082 RNA, herein designated VGAM RNA, and which when bound by VGAM1082 RNA causes inhibition of translation of respective one or more VGAM1082 host target proteins.

[39490] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1082 gene, herein designated VGAM GENE, on one or more VGAM1082 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[39491] It is yet further appreciated that a function of VGAM1082 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1082 include diagnosis, prevention and treatment of viral infection by Porcine Epidemic Diarrhea Virus. Specific functions, and accordingly utilities, of VGAM1082 correlate with, and may be deduced from, the identity of the host target genes which VGAM1082 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[39492] Nucleotide sequences of the VGAM1082 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1082 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1082 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1082 are further described hereinbelow with reference to Table 1.

[39493] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1082 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1082 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[39494] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1082 gene, herein designated VGAM is inhibition of expression of VGAM1082 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1082 correlate with, and may be deduced from, the identity of the target genes which VGAM1082 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[39495] Solute Carrier Family 30 (zinc transporter), Member 3 (SLC30A3, Accession NM_003459) is a VGAM1082 host target gene. SLC30A3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC30A3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC30A3 BINDING SITE,

designated SEQ ID:9529, to the nucleotide sequence of VGAM1082 RNA, herein designated VGAM RNA, also designated SEQ ID:3793.

[39496] A function of VGAM1082 is therefore inhibition of Solute Carrier Family 30 (zinc transporter), Member 3 (SLC30A3, Accession NM_003459). Accordingly, utilities of VGAM1082 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC30A3. FLJ20294 (Accession NM_017749) is another VGAM1082 host target gene. FLJ20294 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20294, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20294 BINDING SITE, designated SEQ ID:19351, to the nucleotide sequence of VGAM1082 RNA, herein designated VGAM RNA, also designated SEQ ID:3793.

[39497] Another function of VGAM1082 is therefore inhibition of FLJ20294 (Accession NM_017749). Accordingly, utilities of VGAM1082 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20294. LOC149721 (Accession XM_086649) is another

VGAM1082 host target gene. LOC149721 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC149721, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149721 BINDING SITE, designated SEQ ID:38812, to the nucleotide sequence of VGAM1082 RNA, herein designated VGAM RNA, also designated SEQ ID:3793.

[39498] Another function of VGAM1082 is therefore inhibition of LOC149721 (Accession XM_086649). Accordingly, utilities of VGAM1082 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149721. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1083 (VGAM1083) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[39499] VGAM1083 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1083 was detected is de-

scribed hereinabove with reference to Figs. 1–8.

[39500] VGAM1083 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Porcine Epidemic Diarrhea Virus. VGAM1083 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[39501] VGAM1083 gene encodes a VGAM1083 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1083 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1083 precursor RNA is designated SEQ ID:1069, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1069 is located at position 13354 relative to the genome of Porcine Epidemic Diarrhea Virus.

[39502] VGAM1083 precursor RNA folds onto itself, forming VGAM1083 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA

gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[39503] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1083 folded precursor RNA into VGAM1083 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM1083 RNA is designated SEQ ID:3794, and is provided hereinbelow with reference to the sequence listing part.

[39504] VGAM1083 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1083 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1083 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[39505] VGAM1083 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM1083 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1083 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1083 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1083 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[39506] The complementary binding of VGAM1083 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1083 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1083 host target RNA into VGAM1083 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[39507] It is appreciated that VGAM1083 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1083 host target genes. The mRNA of each one of this plurality of VGAM1083 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1083 RNA, herein designated VGAM RNA, and which when bound by VGAM1083 RNA causes inhibition of translation of respective one or more VGAM1083 host target proteins.

[39508] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1083 gene, herein designated VGAM GENE, on one or more VGAM1083 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[39509] It is yet further appreciated that a function of VGAM1083 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1083 include diagnosis, prevention and treatment of viral infection by Porcine Epidemic Diarrhea Virus. Specific functions, and accordingly utilities, of VGAM1083 correlate with, and may be deduced from, the identity of the host target genes which VGAM1083 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[39510] Nucleotide sequences of the VGAM1083 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1083 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding

of VGAM1083 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1083 are further described hereinbelow with reference to Table 1.

[39511] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1083 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1083 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[39512] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1083 gene, herein designated VGAM is inhibition of expression of VGAM1083 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1083 correlate with, and may be deduced from, the identity of the target genes which VGAM1083 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[39513] HNF3G (Accession XM_051332) is a VGAM1083 host target gene. HNF3G BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HNF3G, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of HNF3G BINDING SITE, designated SEQ ID:35809, to the nucleotide sequence of VGAM1083 RNA, herein designated VGAM RNA, also designated SEQ ID:3794.

[39514] A function of VGAM1083 is therefore inhibition of HNF3G (Accession XM_051332). Accordingly, utilities of VGAM1083 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HNF3G. Lamin B Receptor (LBR, Accession XM_001795) is another VGAM1083 host target gene. LBR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LBR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LBR BINDING SITE, designated SEQ ID:29855, to the nucleotide sequence of VGAM1083 RNA, herein designated VGAM RNA, also designated SEQ ID:3794.

[39515] Another function of VGAM1083 is therefore inhibition of Lamin B Receptor (LBR, Accession XM_001795). Accordingly, utilities of VGAM1083 include diagnosis, prevention and treatment of diseases and clinical conditions associ-

ated with LBR. Myeloid Cell Leukemia Sequence 1 (BCL2-related) (MCL1, Accession NM_021960) is another VGAM1083 host target gene. MCL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MCL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MCL1 BINDING SITE, designated SEQ ID:22489, to the nucleotide sequence of VGAM1083 RNA, herein designated VGAM RNA, also designated SEQ ID:3794.

[39516] Another function of VGAM1083 is therefore inhibition of Myeloid Cell Leukemia Sequence 1 (BCL2-related) (MCL1, Accession NM_021960), a gene which involved in programming of differentiation and concomitant maintenance of viability. Accordingly, utilities of VGAM1083 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MCL1. The function of MCL1 has been established by previous studies. Kozopas et al. (1993) isolated a gene, MCL1, from the ML-1 human myeloid leukemia cell line. Expression of MCL1 increased early in the induction, or programming, of differentiation in ML-1 (at 1-3 hr), before the appearance of differentia-

tion markers and mature morphology (at 1–3 days). MCL1 showed sequence similarity, particularly in the carboxyl portion, to BCL2 (OMIM Ref. No. 151430), a gene involved in normal lymphoid development and in lymphomas with the t(14;18) chromosome translocation. Further, in contrast to proliferation-associated oncogenes, the expression of MCL1 and BCL2 relates to the programming of differentiation/development and cell viability/death. Kozopas et al. (1993) suggested that MCL1 and BCL2 are 2 members of a 'new' gene family. Bae et al. (2000) identified a short splicing variant of MCL1, which they termed MCL1S. Sequence analysis indicated that the 271-amino acid variant lacks BCL2 homology domains 1 and 2 and the transmembrane domain due to the splicing out of exon 2 during mRNA processing. Unlike the full-length 350-amino acid MCL1 protein (MCL1L), yeast 2-hybrid analysis showed that MCL1S does not interact with proapoptotic BCL2 family proteins but dimerizes with the antiapoptotic MCL1L. Overexpression of MCL1S induced apoptosis in transfected CHO cells that could be antagonized by a caspase inhibitor or specifically by MCL1L. Therefore, the authors concluded that the fate of MCL1-expressing cells may be regulated through alterna-

tive splicing mechanisms and the interactions of the resulting gene products. Using the methods of somatic cell hybrid analysis and fluorescence in situ hybridization, Craig et al. (1994) mapped MCL1 to 1q21. In the mouse, MCL1-related sequences were mapped to positions on 2 mouse chromosomes, 3 and 5, using haplotype analysis of an interspecific cross. The locus on mouse chromosome 3, Mcl1, was homologous to MCL1 on human chromosome 1; the second locus, Mcl-rs, on mouse chromosome 5, may represent a pseudogene. The proximal long arm of human chromosome 1, where MCL1 is located, is duplicated and/or rearranged in a variety of preneoplastic and neoplastic diseases, including hematologic and solid tumors. Thus, MCL1 is a candidate gene for involvement in cancer. Animal model experiments lend further support to the function of MCL1. Rinkenberger et al. (2000) disrupted the Mcl1 locus in murine ES cells to determine the developmental roles of this Bcl2 family member. Deletion of Mcl1 resulted in periimplantation embryonic lethality. Homozygous Mcl1-deficient embryos did not implant in utero, but could be recovered at E3.5 to E4.0. Null blastocysts failed to hatch or attach in vitro, indicating a trophoblast defect, although the inner cell mass could

grow in culture. Of note, homozygous Mcl1-deficient blastocysts showed no evidence of increased apoptosis, but exhibited a delay in maturation beyond the precompaction stage. This model indicates that Mcl1 is essential for preimplantation development and implantation, and suggests that it has a function beyond regulating apoptosis.

[39517] It is appreciated that the abovementioned animal model for MCL1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[39518] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[39519] Kozopas, K. M.; Yang, T.; Buchan, H. L.; Zhou, P.; Craig, R. W. : MCL1, a gene expressed in programmed myeloid cell differentiation, has sequence similarity to BCL2. Proc. Nat. Acad. Sci. 90: 3516–3520, 1993. ; and

[39520] Bae, J.; Leo, C. P.; Hsu, S. Y.; Hsueh, A. J. W. : MCL-1S, a splicing variant of the antiapoptotic BCL-2 family member MCL-1, encodes a proapoptotic protein possessing only the BH3 domain.

[39521] Further studies establishing the function and utilities of

MCL1 are found in John Hopkins OMIM database record ID 159552, and in cited publications numbered 3382–3385 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. T, Brachyury Homolog (mouse) (T, Accession NM_003181) is another VGAM1083 host target gene. T BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by T, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of T BINDING SITE, designated SEQ ID:9153, to the nucleotide sequence of VGAM1083 RNA, herein designated VGAM RNA, also designated SEQ ID:3794.

[39522] Another function of VGAM1083 is therefore inhibition of T, Brachyury Homolog (mouse) (T, Accession NM_003181), a gene which is a potent transcription factor. Accordingly, utilities of VGAM1083 include diagnosis, prevention and treatment of diseases and clinical conditions associated with T. The function of T has been established by previous studies. T protein is vital for the formation and differentiation of posterior mesoderm and for axial development in all vertebrates. Edwards et al. (1996) cited as evidence the

analysis of T mutant mice and zebrafish. 'Brachyury' mutant mice lack T protein and die in utero with abnormal notochord, absent somites, and reduced allantois. In zebrafish the 'no tail' mutation (ntl) is the homolog of 'Brachyury.' Ntl embryos die after hatching, lack notochords and tails, and possess abnormal trunk somites. The T gene encodes a transcription factor that binds to a specific DNA element via its N-terminal region. A protein motif within the DNA-binding domain, the so-called T box, is highly conserved among T homologs from different species and also defines a broader family of T-box genes; see TBX2 (OMIM Ref. No. 600747). Using the rat c-myc gene driven by a human metallothionein promoter, Abe et al. (2000) created several transgenic mouse lines. All of the males were sterile except those in line 137, indicating that the transgene is functionless in that line. However, most of the mice in line 137 had a kinked or bent tail. Abe et al. (2000) found that the transgene was integrated within intron 7 of the mouse Brachyury (T) gene and referred to the mutation as T-137, a null allele of the T gene. T-137 homozygotes showed an embryonic lethal phenotype. At embryonic day 9.5, fragmentation of the notochord was seen both anteriorly and posteriorly. At

embryonic day 10.5, the embryos tended to have an un-looped heart tube and a swollen pericardium cavity, indicating abnormality in heart function. The embryos died after embryonic day 10.5.

[39523] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[39524] Abe, K.; Yamamura, K.; Suzuki, M. : Molecular and embryological characterization of a new transgene-induced null allele of mouse Brachyury locus. Mammalian Genome 11: 238–240, 2000. ; and

[39525] Edwards, Y. H.; Putt, W.; Lekoape, K. M.; Stott, D.; Fox, M.; Hopkinson, D. A.; Sowden, J. : The human homolog T of the mouse T (Brachyury) gene: gene structure, cDNA sequence, and ass.

[39526] Further studies establishing the function and utilities of T are found in John Hopkins OMIM database record ID 601397, and in cited publications numbered 648 and 6490–6495 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Transglutaminase 4 (prostate) (TGM4, Accession NM_003241) is another VGAM1083 host target gene. TGM4 BINDING SITE is HOST TARGET binding site found in

the 3' untranslated region of mRNA encoded by TGM4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TGM4 BINDING SITE, designated SEQ ID:9235, to the nucleotide sequence of VGAM1083 RNA, herein designated VGAM RNA, also designated SEQ ID:3794.

[39527] Another function of VGAM1083 is therefore inhibition of Transglutaminase 4 (prostate) (TGM4, Accession NM_003241), a gene which catalyzes the cross-linking of proteins and the conjugation of polyamines to specific proteins in the seminal tract. Accordingly, utilities of VGAM1083 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TGM4. The function of TGM4 has been established by previous studies. In rodents, TGP is involved in the formation of copulatory plugs in the female genital tract after coitus, and may play a role in masking the antigenicity of the male gamete, thereby suppressing an immune response in the female genital tract against the sperm cells. By screening a human prostate library with a cDNA segment corresponding to the active-site region of TGC (TGM2), Dubbink et al. (1996) isolated a cDNA encoding human

TGP. The predicted 684-amino acid protein is 53% identical to rat TGP. In vitro translated human TGP has a molecular mass of approximately 77 kD. Northern blot analysis revealed that TGP is expressed as a 3.5-kb mRNA exclusively in prostate. Androgen induced TGP expression approximately 3-fold in a human prostate cancer cell line. Independently, Grant et al. (1994) cloned TGM4 cDNAs. They reported that the predicted protein contains 679 amino acids.

[39528] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[39529] Dubbink, H. J.; Verkaik, N. S.; Faber, P. W.; Trapman, J.; Schroder, F. H.; Romijn, J. C. : Tissue-specific and androgen-regulated expression of human prostate-specific transglutaminase. *Biochem. J.* 315: 901-908, 1996. ; and

[39530] Grant, F. J.; Taylor, D. A.; Sheppard, P. O.; Mathewes, S. L.; Lint, W.; Vanaja, E.; Bishop, P. D.; O'Hara, P. J. : Molecular cloning and characterization of a novel transglutaminase cDN.

[39531] Further studies establishing the function and utilities of TGM4 are found in John Hopkins OMIM database record ID 600585, and in cited publications numbered

10212–10214 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. CGG Triplet Repeat Binding Protein 1 (CGGBP1, Accession NM_003663) is another VGAM1083 host target gene. CGGBP1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by CGGBP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CGGBP1 BINDING SITE, designated SEQ ID:9738, to the nucleotide sequence of VGAM1083 RNA, herein designated VGAM RNA, also designated SEQ ID:3794.

[39532] Another function of VGAM1083 is therefore inhibition of CGG Triplet Repeat Binding Protein 1 (CGGBP1, Accession NM_003663). Accordingly, utilities of VGAM1083 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CGGBP1. E74-like Factor 4 (ets domain transcription factor) (ELF4, Accession NM_001421) is another VGAM1083 host target gene. ELF4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ELF4, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ELF4 BINDING SITE, designated SEQ ID:7127, to the nucleotide sequence of VGAM1083 RNA, herein designated VGAM RNA, also designated SEQ ID:3794.

[39533] Another function of VGAM1083 is therefore inhibition of E74-like Factor 4 (ets domain transcription factor) (ELF4, Accession NM_001421). Accordingly, utilities of VGAM1083 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ELF4. MGC4832 (Accession NM_145061) is another VGAM1083 host target gene. MGC4832 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC4832, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC4832 BINDING SITE, designated SEQ ID:29701, to the nucleotide sequence of VGAM1083 RNA, herein designated VGAM RNA, also designated SEQ ID:3794.

[39534] Another function of VGAM1083 is therefore inhibition of MGC4832 (Accession NM_145061). Accordingly, utilities of VGAM1083 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with MGC4832. Purinergic Receptor P2X-like 1, Orphan Receptor (P2RXL1, Accession NM_005446) is another VGAM1083 host target gene. P2RXL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by P2RXL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of P2RXL1 BINDING SITE, designated SEQ ID:11931, to the nucleotide sequence of VGAM1083 RNA, herein designated VGAM RNA, also designated SEQ ID:3794.

[39535] Another function of VGAM1083 is therefore inhibition of Purinergic Receptor P2X-like 1, Orphan Receptor (P2RXL1, Accession NM_005446). Accordingly, utilities of VGAM1083 include diagnosis, prevention and treatment of diseases and clinical conditions associated with P2RXL1. TRIP-Br2 (Accession NM_014755) is another VGAM1083 host target gene. TRIP-Br2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRIP-Br2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of TRIP-Br2 BINDING SITE, designated SEQ ID:16482, to the nucleotide sequence of VGAM1083 RNA, herein designated VGAM RNA, also designated SEQ ID:3794.

[39536] Another function of VGAM1083 is therefore inhibition of TRIP-Br2 (Accession NM_014755). Accordingly, utilities of VGAM1083 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIP-Br2. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1084 (VGAM1084) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[39537] VGAM1084 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1084 was detected is described hereinabove with reference to Figs. 1-8.

[39538] VGAM1084 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Porcine Epidemic Diarrhea Virus. VGAM1084 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene con-

tained in the human genome.

[39539] VGAM1084 gene encodes a VGAM1084 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1084 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1084 precursor RNA is designated SEQ ID:1070, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1070 is located at position 11654 relative to the genome of Porcine Epidemic Diarrhea Virus.

[39540] VGAM1084 precursor RNA folds onto itself, forming VGAM1084 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[39541] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1084 folded precursor RNA into VGAM1084 RNA, herein designated VGAM RNA, a single stranded ~22

nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM1084 RNA is designated SEQ ID:3795, and is provided hereinbelow with reference to the sequence listing part.

[39542] VGAM1084 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1084 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1084 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[39543] VGAM1084 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1084 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1084 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1084 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1084 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[39544] The complementary binding of VGAM1084 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1084 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1084 host target RNA into VGAM1084 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[39545] It is appreciated that VGAM1084 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1084 host target genes. The mRNA of each one of this plurality of VGAM1084 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1084 RNA, herein designated VGAM RNA, and which when bound by VGAM1084 RNA causes inhibition of translation of respective one or more VGAM1084 host target proteins.

[39546] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1084 gene, herein designated VGAM GENE, on one or more VGAM1084 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[39547] It is yet further appreciated that a function of VGAM1084 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1084 include diagnosis, prevention and treatment of viral infection by Porcine Epidemic Diarrhea Virus. Specific functions, and accordingly utilities, of VGAM1084 correlate with, and may be deduced from, the identity of the host target genes which VGAM1084 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[39548] Nucleotide sequences of the VGAM1084 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1084 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1084 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1084 are further described hereinbelow with reference to Table 1.

[39549] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM1084 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1084 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[39550] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1084 gene, herein designated VGAM is inhibition of expression of VGAM1084 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1084 correlate with, and may be deduced from, the identity of the target genes which VGAM1084 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[39551] Fibromodulin (FMOD, Accession NM_002023) is a VGAM1084 host target gene. FMOD BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FMOD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FMOD BINDING SITE, designated SEQ ID:7773, to the nucleotide sequence of VGAM1084 RNA, herein designated VGAM RNA, also designated SEQ ID:3795.

[39552] A function of VGAM1084 is therefore inhibition of Fibro-modulin (FMOD, Accession NM_002023), a gene which affects the rate of fibrils formation. Accordingly, utilities of VGAM1084 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FMOD. The function of FMOD and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM39. Ribonuclease/angiogenin Inhibitor (RNH, Accession NM_002939) is another VGAM1084 host target gene. RNH BINDING SITE1 and RNH BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by RNH, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNH BINDING SITE1 and RNH BINDING SITE2, designated SEQ ID:8846 and SEQ ID:29995 respectively, to the nucleotide sequence of VGAM1084 RNA, herein designated VGAM RNA, also designated SEQ ID:3795.

[39553] Another function of VGAM1084 is therefore inhibition of Ribonuclease/angiogenin Inhibitor (RNH, Accession NM_002939), a gene which is an inhibitor of pancreatic

rnase and angiogenin. may also function in the modulation of cellular activities. Accordingly, utilities of VGAM1084 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNH. The function of RNH and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM484. ELKS (Accession NM_015064) is another VGAM1084 host target gene. ELKS BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ELKS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ELKS BINDING SITE, designated SEQ ID:17418, to the nucleotide sequence of VGAM1084 RNA, herein designated VGAM RNA, also designated SEQ ID:3795.

[39554] Another function of VGAM1084 is therefore inhibition of ELKS (Accession NM_015064). Accordingly, utilities of VGAM1084 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ELKS. FLJ22313 (Accession NM_022373) is another VGAM1084 host target gene. FLJ22313 BINDING SITE is HOST TARGET

binding site found in the 5` untranslated region of mRNA encoded by FLJ22313, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22313 BINDING SITE, designated SEQ ID:22761, to the nucleotide sequence of VGAM1084 RNA, herein designated VGAM RNA, also designated SEQ ID:3795.

[39555] Another function of VGAM1084 is therefore inhibition of FLJ22313 (Accession NM_022373). Accordingly, utilities of VGAM1084 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22313. FLJ23519 (Accession XM_044932) is another VGAM1084 host target gene. FLJ23519 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ23519, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23519 BINDING SITE, designated SEQ ID:34309, to the nucleotide sequence of VGAM1084 RNA, herein designated VGAM RNA, also designated SEQ ID:3795.

[39556] Another function of VGAM1084 is therefore inhibition of

FLJ23519 (Accession XM_044932). Accordingly, utilities of VGAM1084 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23519. MGC4309 (Accession NM_024115) is another VGAM1084 host target gene. MGC4309 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC4309, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC4309 BINDING SITE, designated SEQ ID:23567, to the nucleotide sequence of VGAM1084 RNA, herein designated VGAM RNA, also designated SEQ ID:3795.

[39557] Another function of VGAM1084 is therefore inhibition of MGC4309 (Accession NM_024115). Accordingly, utilities of VGAM1084 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4309. Zinc Finger Protein 33a (KOX 31) (ZNF33A, Accession XM_166119) is another VGAM1084 host target gene. ZNF33A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF33A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of ZNF33A BINDING SITE, designated SEQ ID:43897, to the nucleotide sequence of VGAM1084 RNA, herein designated VGAM RNA, also designated SEQ ID:3795.

[39558] Another function of VGAM1084 is therefore inhibition of Zinc Finger Protein 33a (KOX 31) (ZNF33A, Accession XM_166119). Accordingly, utilities of VGAM1084 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF33A. LOC152503 (Accession XM_098238) is another VGAM1084 host target gene. LOC152503 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC152503, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152503 BINDING SITE, designated SEQ ID:41517, to the nucleotide sequence of VGAM1084 RNA, herein designated VGAM RNA, also designated SEQ ID:3795.

[39559] Another function of VGAM1084 is therefore inhibition of LOC152503 (Accession XM_098238). Accordingly, utilities of VGAM1084 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC152503. LOC51236 (Accession NM_016458) is another VGAM1084 host target gene. LOC51236 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51236, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51236 BINDING SITE, designated SEQ ID:18569, to the nucleotide sequence of VGAM1084 RNA, herein designated VGAM RNA, also designated SEQ ID:3795.

[39560] Another function of VGAM1084 is therefore inhibition of LOC51236 (Accession NM_016458). Accordingly, utilities of VGAM1084 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51236. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1085 (VGAM1085) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[39561] VGAM1085 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1085 was detected is described hereinabove with reference to Figs. 1–8.

[39562] VGAM1085 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Porcine Epidemic Diarrhea Virus. VGAM1085 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[39563] VGAM1085 gene encodes a VGAM1085 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1085 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1085 precursor RNA is designated SEQ ID:1071, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1071 is located at position 14382 relative to the genome of Porcine Epidemic Diarrhea Virus.

[39564] VGAM1085 precursor RNA folds onto itself, forming VGAM1085 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by

miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[39565] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1085 folded precursor RNA into VGAM1085 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 48%) nucleotide sequence of VGAM1085 RNA is designated SEQ ID:3796, and is provided hereinbelow with reference to the sequence listing part.

[39566] VGAM1085 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1085 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1085 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[39567] VGAM1085 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1085 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1085 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1085 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1085 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[39568] The complementary binding of VGAM1085 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM1085 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1085 host target RNA into VGAM1085 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[39569] It is appreciated that VGAM1085 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1085 host target genes. The mRNA of each one of this plurality of VGAM1085 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1085 RNA, herein designated VGAM RNA, and which when bound by VGAM1085 RNA causes inhibition of translation of respective one or more VGAM1085 host target proteins.

[39570] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1085 gene, herein designated VGAM GENE, on one or more VGAM1085 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[39571] It is yet further appreciated that a function of VGAM1085 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1085 include diagnosis, prevention and treatment of viral infection by Porcine Epidemic Diarrhea Virus. Specific functions, and accordingly utilities, of VGAM1085 correlate with, and may be deduced from, the identity of the host target genes which VGAM1085 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[39572] Nucleotide sequences of the VGAM1085 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM1085 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1085 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1085 are further described hereinbelow with reference to Table 1.

[39573] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1085 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1085 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[39574] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1085 gene, herein designated VGAM is inhibition of expression of VGAM1085 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1085 correlate with, and may be deduced from, the identity of the target genes which VGAM1085 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[39575] HCS (Accession NM_018947) is a VGAM1085 host target gene. HCS BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

HCS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HCS BINDING SITE, designated SEQ ID:21015, to the nucleotide sequence of VGAM1085 RNA, herein designated VGAM RNA, also designated SEQ ID:3796.

[39576] A function of VGAM1085 is therefore inhibition of HCS (Accession NM_018947). Accordingly, utilities of VGAM1085 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HCS. FLJ11164 (Accession NM_018346) is another VGAM1085 host target gene. FLJ11164 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ11164, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11164 BINDING SITE, designated SEQ ID:20356, to the nucleotide sequence of VGAM1085 RNA, herein designated VGAM RNA, also designated SEQ ID:3796.

[39577] Another function of VGAM1085 is therefore inhibition of FLJ11164 (Accession NM_018346). Accordingly, utilities of VGAM1085 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ11164. Mitogen-activated Protein Kinase-activated Protein Kinase 3 (MAPKAPK3, Accession NM_004635) is another VGAM1085 host target gene. MAPKAPK3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MAPKAPK3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAPKAPK3 BINDING SITE, designated SEQ ID:11011, to the nucleotide sequence of VGAM1085 RNA, herein designated VGAM RNA, also designated SEQ ID:3796.

[39578] Another function of VGAM1085 is therefore inhibition of Mitogen-activated Protein Kinase-activated Protein Kinase 3 (MAPKAPK3, Accession NM_004635). Accordingly, utilities of VGAM1085 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAPKAPK3. SE57-1 (Accession NM_025214) is another VGAM1085 host target gene. SE57-1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SE57-1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of SE57-1 BINDING SITE, designated SEQ ID:24892, to the nucleotide sequence of VGAM1085 RNA, herein designated VGAM RNA, also designated SEQ ID:3796.

[39579] Another function of VGAM1085 is therefore inhibition of SE57-1 (Accession NM_025214). Accordingly, utilities of VGAM1085 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SE57-1. LOC143920 (Accession XM_084658) is another VGAM1085 host target gene. LOC143920 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC143920, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143920 BINDING SITE, designated SEQ ID:37638, to the nucleotide sequence of VGAM1085 RNA, herein designated VGAM RNA, also designated SEQ ID:3796.

[39580] Another function of VGAM1085 is therefore inhibition of LOC143920 (Accession XM_084658). Accordingly, utilities of VGAM1085 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143920. LOC157317 (Accession XM_088293) is an-

other VGAM1085 host target gene. LOC157317 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC157317, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157317 BINDING SITE, designated SEQ ID:39585, to the nucleotide sequence of VGAM1085 RNA, herein designated VGAM RNA, also designated SEQ ID:3796.

[39581] Another function of VGAM1085 is therefore inhibition of LOC157317 (Accession XM_088293). Accordingly, utilities of VGAM1085 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157317. LOC203429 (Accession XM_114701) is another VGAM1085 host target gene. LOC203429 BINDING SITE1 and LOC203429 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LOC203429, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203429 BINDING SITE1 and LOC203429 BINDING SITE2, designated SEQ ID:43049 and SEQ ID:43050 respectively, to the nucleotide se-

quence of VGAM1085 RNA, herein designated VGAM RNA, also designated SEQ ID:3796.

[39582] Another function of VGAM1085 is therefore inhibition of LOC203429 (Accession XM_114701). Accordingly, utilities of VGAM1085 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203429. CBCIP2 (Accession NM_032831) is another VGAM1086 host target gene. CBCIP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CBCIP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CBCIP2 BINDING SITE, designated SEQ ID:26606, to the nucleotide sequence of VGAM1086 RNA, herein designated VGAM RNA, also designated SEQ ID:3797.

[39583] Another function of VGAM1086 is therefore inhibition of CBCIP2 (Accession NM_032831). Accordingly, utilities of VGAM1086 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CBCIP2. Cyclin M1 (CNNM1, Accession NM_020348) is another VGAM1086 host target gene. CNNM1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by CNNM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CNNM1 BINDING SITE, designated SEQ ID:21604, to the nucleotide sequence of VGAM1086 RNA, herein designated VGAM RNA, also designated SEQ ID:3797.

[39584] Another function of VGAM1086 is therefore inhibition of Cyclin M1 (CNNM1, Accession NM_020348). Accordingly, utilities of VGAM1086 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CNNM1. FLJ00024 (Accession XM_033361) is another VGAM1086 host target gene. FLJ00024 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ00024, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ00024 BINDING SITE, designated SEQ ID:31897, to the nucleotide sequence of VGAM1086 RNA, herein designated VGAM RNA, also designated SEQ ID:3797.

[39585] Another function of VGAM1086 is therefore inhibition of FLJ00024 (Accession XM_033361). Accordingly, utilities of

VGAM1086 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ00024. FLJ13984 (Accession NM_024770) is another VGAM1086 host target gene. FLJ13984 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ13984, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13984 BINDING SITE, designated SEQ ID:24130, to the nucleotide sequence of VGAM1086 RNA, herein designated VGAM RNA, also designated SEQ ID:3797.

[39586] Another function of VGAM1086 is therefore inhibition of FLJ13984 (Accession NM_024770). Accordingly, utilities of VGAM1086 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13984. LOC196485 (Accession XM_113731) is another VGAM1086 host target gene. LOC196485 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC196485, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

LOC196485 BINDING SITE, designated SEQ ID:42382, to the nucleotide sequence of VGAM1086 RNA, herein designated VGAM RNA, also designated SEQ ID:3797.

[39587] Another function of VGAM1086 is therefore inhibition of LOC196485 (Accession XM_113731). Accordingly, utilities of VGAM1086 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196485. LOC202986 (Accession XM_117489) is another VGAM1086 host target gene. LOC202986 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC202986, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC202986 BINDING SITE, designated SEQ ID:43473, to the nucleotide sequence of VGAM1086 RNA, herein designated VGAM RNA, also designated SEQ ID:3797.

[39588] Another function of VGAM1086 is therefore inhibition of LOC202986 (Accession XM_117489). Accordingly, utilities of VGAM1086 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC202986. LOC221354 (Accession XM_166468) is another VGAM1086 host target gene. LOC221354 BINDING

SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221354, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221354 BINDING SITE, designated SEQ ID:44393, to the nucleotide sequence of VGAM1086 RNA, herein designated VGAM RNA, also designated SEQ ID:3797.

[39589] Another function of VGAM1086 is therefore inhibition of LOC221354 (Accession XM_166468). Accordingly, utilities of VGAM1086 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221354. LOC90333 (Accession XM_030958) is another VGAM1086 host target gene. LOC90333 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90333, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90333 BINDING SITE, designated SEQ ID:31219, to the nucleotide sequence of VGAM1086 RNA, herein designated VGAM RNA, also designated SEQ ID:3797.

[39590] Another function of VGAM1086 is therefore inhibition of

LOC90333 (Accession XM_030958). Accordingly, utilities of VGAM1086 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90333. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1087 (VGAM1087) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[39591] VGAM1087 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1087 was detected is described hereinabove with reference to Figs. 1-8.

[39592] VGAM1087 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Porcine Epidemic Diarrhea Virus. VGAM1087 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[39593] VGAM1087 gene encodes a VGAM1087 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1087 precursor RNA does not encode a protein. A

nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1087 precursor RNA is designated SEQ ID:1073, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1073 is located at position 5802 relative to the genome of Porcine Epidemic Diarrhea Virus.

- [39594] VGAM1087 precursor RNA folds onto itself, forming VGAM1087 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [39595] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1087 folded precursor RNA into VGAM1087 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide se-

quence of VGAM1087 RNA is designated SEQ ID:3798, and is provided hereinbelow with reference to the sequence listing part.

[39596] VGAM1087 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1087 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1087 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[39597] VGAM1087 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1087 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1087 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting – VGAM1087 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1087 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[39598] The complementary binding of VGAM1087 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1087 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1087 host target RNA into VGAM1087 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[39599] It is appreciated that VGAM1087 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1087 host target genes. The mRNA of each one of this plurality of VGAM1087 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM1087 RNA, herein designated VGAM RNA, and which when bound by VGAM1087 RNA causes inhibition of translation of respective one or more VGAM1087 host target proteins.

[39600] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1087 gene, herein designated VGAM GENE, on one or more VGAM1087 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[39601] It is yet further appreciated that a function of VGAM1087

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1087 include diagnosis, prevention and treatment of viral infection by Porcine Epidemic Diarrhea Virus. Specific functions, and accordingly utilities, of VGAM1087 correlate with, and may be deduced from, the identity of the host target genes which VGAM1087 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[39602] Nucleotide sequences of the VGAM1087 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1087 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1087 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1087 are further described hereinbelow with reference to Table 1.

[39603] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1087 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1087 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[39604] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1087 gene, herein designated VGAM is inhibition of expression of VGAM1087 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1087 correlate with, and may be deduced from, the identity of the target genes which VGAM1087 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[39605] PAG (Accession NM_018440) is a VGAM1087 host target gene. PAG BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PAG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PAG BINDING SITE, designated SEQ ID:20509, to the nucleotide sequence of VGAM1087 RNA, herein designated VGAM RNA, also designated SEQ ID:3798.

[39606] A function of VGAM1087 is therefore inhibition of PAG (Accession NM_018440). Accordingly, utilities of VGAM1087 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PAG. Phosphoprotein Enriched In Astrocytes 15 (PEA15, Accession NM_003768) is another VGAM1087 host target gene.

PEA15 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PEA15, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PEA15 BINDING SITE, designated SEQ ID:9848, to the nucleotide sequence of VGAM1087 RNA, herein designated VGAM RNA, also designated SEQ ID:3798.

[39607] Another function of VGAM1087 is therefore inhibition of Phosphoprotein Enriched In Astrocytes 15 (PEA15, Accession NM_003768), a gene which is a phosphoprotein and involved in glucose uptake. Accordingly, utilities of VGAM1087 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PEA15. The function of PEA15 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM949.Xeroderma Pigmentosum, Complementation Group C (XPC, Accession NM_004628) is another VGAM1087 host target gene. XPC BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by XPC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of XPC BINDING SITE, designated SEQ ID:10999, to the nucleotide sequence of VGAM1087 RNA, herein designated VGAM RNA, also designated SEQ ID:3798.

[39608] Another function of VGAM1087 is therefore inhibition of Xeroderma Pigmentosum, Complementation Group C (XPC, Accession NM_004628). Accordingly, utilities of VGAM1087 include diagnosis, prevention and treatment of diseases and clinical conditions associated with XPC. Bromodomain Containing 3 (BRD3, Accession NM_007371) is another VGAM1087 host target gene. BRD3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BRD3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BRD3 BINDING SITE, designated SEQ ID:14297, to the nucleotide sequence of VGAM1087 RNA, herein designated VGAM RNA, also designated SEQ ID:3798.

[39609] Another function of VGAM1087 is therefore inhibition of Bromodomain Containing 3 (BRD3, Accession NM_007371). Accordingly, utilities of VGAM1087 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with BRD3. Chromosome 21 Open Reading Frame 108 (C21orf108, Accession XM_114191) is another VGAM1087 host target gene. C21orf108 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C21orf108, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C21orf108 BINDING SITE, designated SEQ ID:42766, to the nucleotide sequence of VGAM1087 RNA, herein designated VGAM RNA, also designated SEQ ID:3798.

[39610] Another function of VGAM1087 is therefore inhibition of Chromosome 21 Open Reading Frame 108 (C21orf108, Accession XM_114191). Accordingly, utilities of VGAM1087 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C21orf108. FLJ22965 (Accession NM_022101) is another VGAM1087 host target gene. FLJ22965 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22965, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22965 BINDING SITE, designated SEQ ID:22644, to the nucleotide sequence of VGAM1087 RNA, herein designated VGAM RNA, also designated SEQ ID:3798.

[39611] Another function of VGAM1087 is therefore inhibition of FLJ22965 (Accession NM_022101). Accordingly, utilities of VGAM1087 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22965. KIAA0895 (Accession XM_166573) is another VGAM1087 host target gene. KIAA0895 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0895, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0895 BINDING SITE, designated SEQ ID:44546, to the nucleotide sequence of VGAM1087 RNA, herein designated VGAM RNA, also designated SEQ ID:3798.

[39612] Another function of VGAM1087 is therefore inhibition of KIAA0895 (Accession XM_166573). Accordingly, utilities of VGAM1087 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA0895. KIAA1305 (Accession NM_025081) is another VGAM1087 host target gene. KIAA1305 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1305, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1305 BINDING SITE, designated SEQ ID:24681, to the nucleotide sequence of VGAM1087 RNA, herein designated VGAM RNA, also designated SEQ ID:3798.

[39613] Another function of VGAM1087 is therefore inhibition of KIAA1305 (Accession NM_025081). Accordingly, utilities of VGAM1087 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1305. MGC4737 (Accession NM_031466) is another VGAM1087 host target gene. MGC4737 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC4737, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC4737 BINDING SITE, designated SEQ ID:25505, to the nucleotide sequence of VGAM1087 RNA, herein designated VGAM

RNA, also designated SEQ ID:3798.

[39614] Another function of VGAM1087 is therefore inhibition of MGC4737 (Accession NM_031466). Accordingly, utilities of VGAM1087 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4737. LOC163812 (Accession XM_089158) is another VGAM1087 host target gene. LOC163812 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC163812, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC163812 BINDING SITE, designated SEQ ID:39967, to the nucleotide sequence of VGAM1087 RNA, herein designated VGAM RNA, also designated SEQ ID:3798.

[39615] Another function of VGAM1087 is therefore inhibition of LOC163812 (Accession XM_089158). Accordingly, utilities of VGAM1087 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC163812. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1088 (VGAM1088) viral gene, which

modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[39616] VGAM1088 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1088 was detected is described hereinabove with reference to Figs. 1–8.

[39617] VGAM1088 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Porcine Epidemic Diarrhea Virus. VGAM1088 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[39618] VGAM1088 gene encodes a VGAM1088 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1088 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1088 precursor RNA is designated SEQ ID:1074, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1074 is located at position 1913 relative to the genome of Porcine Epidemic Diarrhea Virus.

[39619] VGAM1088 precursor RNA folds onto itself, forming

VGAM1088 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[39620] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1088 folded precursor RNA into VGAM1088 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1088 RNA is designated SEQ ID:3799, and is provided hereinbelow with reference to the sequence listing part.

[39621] VGAM1088 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1088 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1088 host target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[39622] VGAM1088 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1088 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1088 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1088 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1088 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example

only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[39623] The complementary binding of VGAM1088 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1088 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1088 host target RNA into VGAM1088 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[39624] It is appreciated that VGAM1088 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1088 host target genes. The mRNA of each one of this plurality of VGAM1088 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1088 RNA, herein designated VGAM RNA, and which when bound by VGAM1088 RNA causes inhibition of translation of respective one or more VGAM1088 host target proteins.

[39625] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM1088 gene, herein designated VGAM GENE, on one or more VGAM1088 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[39626] It is yet further appreciated that a function of VGAM1088 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1088 include diagnosis, prevention and treatment of viral infection by Porcine Epidemic Diarrhea Virus. Specific functions, and accordingly utilities, of VGAM1088 correlate with, and may be deduced from, the identity of the host target genes which VGAM1088 binds

and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[39627] Nucleotide sequences of the VGAM1088 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1088 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1088 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1088 are further described hereinbelow with reference to Table 1.

[39628] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1088 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1088 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[39629] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1088 gene, herein designated VGAM is inhibition of expression of VGAM1088 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1088 correlate with, and may be deduced from, the identity of the target genes which VGAM1088 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[39630] Cytotoxic T-lymphocyte-associated Protein 4 (CTLA4, Accession NM_005214) is a VGAM1088 host target gene. CTLA4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CTLA4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CTLA4 BINDING SITE, designated SEQ ID:11711, to the nucleotide sequence of VGAM1088 RNA, herein designated VGAM RNA, also designated SEQ ID:3799.

[39631] A function of VGAM1088 is therefore inhibition of Cytotoxic T-lymphocyte-associated Protein 4 (CTLA4, Accession NM_005214). Accordingly, utilities of VGAM1088 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CTLA4. Neuronal Cell Adhesion Molecule (NRCAM, Accession NM_005010) is another VGAM1088 host target gene. NRCAM BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NRCAM, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of NRCAM BINDING SITE, designated SEQ ID:11448, to the nucleotide sequence of VGAM1088 RNA, herein designated VGAM RNA, also designated SEQ ID:3799.

[39632] Another function of VGAM1088 is therefore inhibition of Neuronal Cell Adhesion Molecule (NRCAM, Accession NM_005010), a gene which functions as a cell surface protein and belongs to the immunoglobulin superfamily. Accordingly, utilities of VGAM1088 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NRCAM. The function of NRCAM and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM268.FLJ21432 (Accession NM_024551) is another VGAM1088 host target gene. FLJ21432 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21432, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21432 BINDING SITE, designated SEQ ID:23766, to the nucleotide sequence of VGAM1088 RNA, herein designated VGAM RNA, also designated SEQ

ID:3799.

[39633] Another function of VGAM1088 is therefore inhibition of FLJ21432 (Accession NM_024551). Accordingly, utilities of VGAM1088 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21432. PP1628 (Accession NM_025201) is another VGAM1088 host target gene. PP1628 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PP1628, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PP1628 BINDING SITE, designated SEQ ID:24857, to the nucleotide sequence of VGAM1088 RNA, herein designated VGAM RNA, also designated SEQ ID:3799.

[39634] Another function of VGAM1088 is therefore inhibition of PP1628 (Accession NM_025201). Accordingly, utilities of VGAM1088 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PP1628. LOC159199 (Accession XM_089441) is another VGAM1088 host target gene. LOC159199 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC159199, corresponding

to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC159199 BINDING SITE, designated SEQ ID:39979, to the nucleotide sequence of VGAM1088 RNA, herein designated VGAM RNA, also designated SEQ ID:3799.

[39635] Another function of VGAM1088 is therefore inhibition of LOC159199 (Accession XM_089441). Accordingly, utilities of VGAM1088 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC159199. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1089 (VGAM1089) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[39636] VGAM1089 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1089 was detected is described hereinabove with reference to Figs. 1-8.

[39637] VGAM1089 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Porcine Epidemic Diar-

rhea Virus. VGAM1089 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[39638] VGAM1089 gene encodes a VGAM1089 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1089 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1089 precursor RNA is designated SEQ ID:1075, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1075 is located at position 3305 relative to the genome of Porcine Epidemic Diarrhea Virus.

[39639] VGAM1089 precursor RNA folds onto itself, forming VGAM1089 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[39640] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM1089 folded precursor RNA into VGAM1089 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 61%) nucleotide sequence of VGAM1089 RNA is designated SEQ ID:3800, and is provided hereinbelow with reference to the sequence listing part.

[39641] VGAM1089 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1089 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1089 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[39642] VGAM1089 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1089 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM1089 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1089 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1089 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[39643] The complementary binding of VGAM1089 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1089 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1089 host target RNA into VGAM1089 host target protein,

herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[39644] It is appreciated that VGAM1089 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1089 host target genes. The mRNA of each one of this plurality of VGAM1089 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1089 RNA, herein designated VGAM RNA, and which when bound by VGAM1089 RNA causes inhibition of translation of respective one or more VGAM1089 host target proteins.

[39645] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1089 gene, herein designated VGAM GENE, on one or more VGAM1089 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[39646] It is yet further appreciated that a function of VGAM1089 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1089 include diagnosis, prevention and treatment of viral infection by Porcine Epidemic Diarrhea Virus. Specific functions, and accordingly utilities, of VGAM1089 correlate with, and may be deduced from, the identity of the host target genes which VGAM1089 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[39647] Nucleotide sequences of the VGAM1089 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1089 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1089 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1089 are further described hereinbelow with reference to Table 1.

[39648] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1089 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1089 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[39649] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1089 gene, herein designated VGAM is inhibition of expression of VGAM1089 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1089 correlate with, and may be deduced from, the identity of the target genes which VGAM1089 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[39650] Hyaluronan Synthase 3 (HAS3, Accession NM_005329) is a VGAM1089 host target gene. HAS3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HAS3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HAS3 BINDING SITE, designated SEQ ID:11802, to the nucleotide sequence of

VGAM1089 RNA, herein designated VGAM RNA, also designated SEQ ID:3800.

[39651] A function of VGAM1089 is therefore inhibition of Hyaluronan Synthase 3 (HAS3, Accession NM_005329), a gene which plays a role in hyaluronan/hyaluronic acid (ha) synthesis. Accordingly, utilities of VGAM1089 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HAS3. The function of HAS3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM498. Chromosome 21 Open Reading Frame 25 (C21orf25, Accession XM_032945) is another VGAM1089 host target gene. C21orf25 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C21orf25, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C21orf25 BINDING SITE, designated SEQ ID:31796, to the nucleotide sequence of VGAM1089 RNA, herein designated VGAM RNA, also designated SEQ ID:3800.

[39652] Another function of VGAM1089 is therefore inhibition of

Chromosome 21 Open Reading Frame 25 (C21orf25, Accession XM_032945). Accordingly, utilities of VGAM1089 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C21orf25. ERG-1 (Accession NM_022034) is another VGAM1089 host target gene. ERG-1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ERG-1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ERG-1 BINDING SITE, designated SEQ ID:22557, to the nucleotide sequence of VGAM1089 RNA, herein designated VGAM RNA, also designated SEQ ID:3800.

[39653] Another function of VGAM1089 is therefore inhibition of ERG-1 (Accession NM_022034). Accordingly, utilities of VGAM1089 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ERG-1. FLJ13590 (Accession NM_024840) is another VGAM1089 host target gene. FLJ13590 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ13590, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13590 BINDING SITE, designated SEQ ID:24250, to the nucleotide sequence of VGAM1089 RNA, herein designated VGAM RNA, also designated SEQ ID:3800.

[39654] Another function of VGAM1089 is therefore inhibition of FLJ13590 (Accession NM_024840). Accordingly, utilities of VGAM1089 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13590. FLJ14810 (Accession NM_032843) is another VGAM1089 host target gene. FLJ14810 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14810, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14810 BINDING SITE, designated SEQ ID:26632, to the nucleotide sequence of VGAM1089 RNA, herein designated VGAM RNA, also designated SEQ ID:3800.

[39655] Another function of VGAM1089 is therefore inhibition of FLJ14810 (Accession NM_032843). Accordingly, utilities of VGAM1089 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

FLJ14810. Internexin Neuronal Intermediate Filament Protein, Alpha (INA, Accession NM_032727) is another VGAM1089 host target gene. INA BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by INA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of INA BINDING SITE, designated SEQ ID:26454, to the nucleotide sequence of VGAM1089 RNA, herein designated VGAM RNA, also designated SEQ ID:3800.

[39656] Another function of VGAM1089 is therefore inhibition of Internexin Neuronal Intermediate Filament Protein, Alpha (INA, Accession NM_032727). Accordingly, utilities of VGAM1089 include diagnosis, prevention and treatment of diseases and clinical conditions associated with INA. INSM2 (Accession NM_032594) is another VGAM1089 host target gene. INSM2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by INSM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of INSM2 BINDING SITE, designated SEQ

ID:26326, to the nucleotide sequence of VGAM1089 RNA, herein designated VGAM RNA, also designated SEQ ID:3800.

[39657] Another function of VGAM1089 is therefore inhibition of INSM2 (Accession NM_032594). Accordingly, utilities of VGAM1089 include diagnosis, prevention and treatment of diseases and clinical conditions associated with INSM2. KIAA0261 (Accession XM_042946) is another VGAM1089 host target gene. KIAA0261 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0261, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0261 BINDING SITE, designated SEQ ID:33830, to the nucleotide sequence of VGAM1089 RNA, herein designated VGAM RNA, also designated SEQ ID:3800.

[39658] Another function of VGAM1089 is therefore inhibition of KIAA0261 (Accession XM_042946). Accordingly, utilities of VGAM1089 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0261. KIAA1483 (Accession XM_045920) is another VGAM1089 host target gene. KIAA1483 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1483, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1483 BINDING SITE, designated SEQ ID:34617, to the nucleotide sequence of VGAM1089 RNA, herein designated VGAM RNA, also designated SEQ ID:3800.

[39659] Another function of VGAM1089 is therefore inhibition of KIAA1483 (Accession XM_045920). Accordingly, utilities of VGAM1089 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1483. KIAA1530 (Accession XM_042661) is another VGAM1089 host target gene. KIAA1530 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1530, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1530 BINDING SITE, designated SEQ ID:33737, to the nucleotide sequence of VGAM1089 RNA, herein designated VGAM RNA, also designated SEQ ID:3800.

[39660] Another function of VGAM1089 is therefore inhibition of

KIAA1530 (Accession XM_042661). Accordingly, utilities of VGAM1089 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1530. Mitochondrial Ribosomal Protein L35 (MRPL35, Accession NM_016622) is another VGAM1089 host target gene. MRPL35 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MRPL35, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MRPL35 BINDING SITE, designated SEQ ID:18733, to the nucleotide sequence of VGAM1089 RNA, herein designated VGAM RNA, also designated SEQ ID:3800.

[39661] Another function of VGAM1089 is therefore inhibition of Mitochondrial Ribosomal Protein L35 (MRPL35, Accession NM_016622). Accordingly, utilities of VGAM1089 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MRPL35. N-ethylmaleimide-sensitive Factor Attachment Protein, Gamma (NAPG, Accession XM_172983) is another VGAM1089 host target gene. NAPG BINDING SITE is HOST TARGET binding site found in the 3' untranslated region

of mRNA encoded by NAPG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NAPG BINDING SITE, designated SEQ ID:46251, to the nucleotide sequence of VGAM1089 RNA, herein designated VGAM RNA, also designated SEQ ID:3800.

[39662] Another function of VGAM1089 is therefore inhibition of N-ethylmaleimide-sensitive Factor Attachment Protein, Gamma (NAPG, Accession XM_172983). Accordingly, utilities of VGAM1089 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NAPG. Solute Carrier Family 26 (sulfate transporter), Member 1 (SLC26A1, Accession NM_022042) is another VGAM1089 host target gene. SLC26A1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC26A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC26A1 BINDING SITE, designated SEQ ID:22567, to the nucleotide sequence of VGAM1089 RNA, herein designated VGAM RNA, also designated SEQ ID:3800.

[39663] Another function of VGAM1089 is therefore inhibition of Solute Carrier Family 26 (sulfate transporter), Member 1 (SLC26A1, Accession NM_022042). Accordingly, utilities of VGAM1089 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC26A1. Serine/threonine Kinase 29 (STK29, Accession XM_113646) is another VGAM1089 host target gene. STK29 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by STK29, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STK29 BINDING SITE, designated SEQ ID:42317, to the nucleotide sequence of VGAM1089 RNA, herein designated VGAM RNA, also designated SEQ ID:3800.

[39664] Another function of VGAM1089 is therefore inhibition of Serine/threonine Kinase 29 (STK29, Accession XM_113646). Accordingly, utilities of VGAM1089 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STK29. LOC162165 (Accession XM_102442) is another VGAM1089 host target gene. LOC162165 BINDING SITE is HOST TARGET binding

site found in the 5` untranslated region of mRNA encoded by LOC162165, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC162165 BINDING SITE, designated SEQ ID:42117, to the nucleotide sequence of VGAM1089 RNA, herein designated VGAM RNA, also designated SEQ ID:3800.

[39665] Another function of VGAM1089 is therefore inhibition of LOC162165 (Accession XM_102442). Accordingly, utilities of VGAM1089 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC162165. LOC196527 (Accession XM_113743) is another VGAM1089 host target gene. LOC196527 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC196527, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196527 BINDING SITE, designated SEQ ID:42400, to the nucleotide sequence of VGAM1089 RNA, herein designated VGAM RNA, also designated SEQ ID:3800.

[39666] Another function of VGAM1089 is therefore inhibition of

LOC196527 (Accession XM_113743). Accordingly, utilities of VGAM1089 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196527. LOC221002 (Accession XM_166156) is another VGAM1089 host target gene. LOC221002 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221002, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221002 BINDING SITE, designated SEQ ID:43972, to the nucleotide sequence of VGAM1089 RNA, herein designated VGAM RNA, also designated SEQ ID:3800.

[39667] Another function of VGAM1089 is therefore inhibition of LOC221002 (Accession XM_166156). Accordingly, utilities of VGAM1089 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221002. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1090 (VGAM1090) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes

is known in the art.

[39668] VGAM1090 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1090 was detected is described hereinabove with reference to Figs. 1–8.

[39669] VGAM1090 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Porcine Epidemic Diarrhea Virus. VGAM1090 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[39670] VGAM1090 gene encodes a VGAM1090 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1090 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1090 precursor RNA is designated SEQ ID:1076, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1076 is located at position 2399 relative to the genome of Porcine Epidemic Diarrhea Virus.

[39671] VGAM1090 precursor RNA folds onto itself, forming VGAM1090 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two–

dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[39672] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1090 folded precursor RNA into VGAM1090 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM1090 RNA is designated SEQ ID:3801, and is provided hereinbelow with reference to the sequence listing part.

[39673] VGAM1090 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1090 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1090 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein cod-

ing region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[39674] VGAM1090 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1090 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1090 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1090 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1090 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR

and 5`UTR regions.

[39675] The complementary binding of VGAM1090 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1090 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1090 host target RNA into VGAM1090 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[39676] It is appreciated that VGAM1090 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1090 host target genes. The mRNA of each one of this plurality of VGAM1090 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1090 RNA, herein designated VGAM RNA, and which when bound by VGAM1090 RNA causes inhibition of translation of respective one or more VGAM1090 host target proteins.

[39677] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1090 gene, herein designated VGAM GENE, on one

or more VGAM1090 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[39678] It is yet further appreciated that a function of VGAM1090 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1090 include diagnosis, prevention and treatment of viral infection by Porcine Epidemic Diarrhea Virus. Specific functions, and accordingly utilities, of VGAM1090 correlate with, and may be deduced from, the identity of the host target genes which VGAM1090 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[39679] Nucleotide sequences of the VGAM1090 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1090 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1090 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1090 are further described hereinbelow with reference to Table 1.

[39680] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1090 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1090 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[39681] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1090 gene, herein designated VGAM is inhibition of expression of VGAM1090 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1090 correlate with, and may be deduced from, the identity of the target genes which VGAM1090 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[39682] B-cell CLL/lymphoma 11A (zinc finger protein) (BCL11A,

Accession NM_018014) is a VGAM1090 host target gene. BCL11A BINDING SITE1 and BCL11A BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by BCL11A, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCL11A BINDING SITE1 and BCL11A BINDING SITE2, designated SEQ ID:19752 and SEQ ID:28852 respectively, to the nucleotide sequence of VGAM1090 RNA, herein designated VGAM RNA, also designated SEQ ID:3801.

[39683] A function of VGAM1090 is therefore inhibition of B-cell CLL/lymphoma 11A (zinc finger protein) (BCL11A, Accession NM_018014), a gene which acts as a transcriptional repressor. Accordingly, utilities of VGAM1090 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCL11A. The function of BCL11A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM190.SWAP70 (Accession XM_049197) is another VGAM1090 host target gene. SWAP70 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by SWAP70, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SWAP70 BINDING SITE, designated SEQ ID:35346, to the nucleotide sequence of VGAM1090 RNA, herein designated VGAM RNA, also designated SEQ ID:3801.

[39684] Another function of VGAM1090 is therefore inhibition of SWAP70 (Accession XM_049197), a gene which is involved not only in nuclear events but also in signaling in B-cell activation. Accordingly, utilities of VGAM1090 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SWAP70. The function of SWAP70 has been established by previous studies. The B-cell receptor is composed of the immunoglobulin (Ig) heavy and light chains and the covalently bound accessory molecules Ig-alpha (CD79A; 112205) and Ig-beta (CD79B; 147245). Crosslinking of the B-cell receptor by antigens stimulates the activation of intracellular protein kinases. B-cell activation leads to hypermutation of the Ig variable regions and to heavy chain class switching, in which the Ig constant region of mu (IgM; OMIM Ref. No. 147020) is replaced by that of another class: gamma (IgG; OMIM Ref.

No. 147100), alpha (IgA; OMIM Ref. No. 146900), or epsilon (IgE; OMIM Ref. No. 147180). Class switching is achieved by a looping out and deletion mechanism between the switch region of mu and the switch region of the isotype that is to be expressed. Masat et al. (2000) explored the possibility that switch-associated protein-70 (OMIM Ref. No. SWAP70) acts as a link between the recognition of specific switch regions and causation of a DNA break. Swap70 had been isolated in the mouse as part of a complex that is able to promote recombination between 2 switch regions in vitro (Borggreffe et al., 1998; Borggreffe et al., 1999). By screening a human lymphoma cDNA library using mouse Swap70 sequences as the probe, Masat et al. (2000) isolated a cDNA encoding SWAP70. Although the 585-amino acid SWAP70 protein contains 3 nuclear localization signals, SWAP70 was found mainly in the cytoplasm in small resting B cells. On stimulation, SWAP70 translocated to the nucleus. In activated, class-switching B cell cultures, it was associated with membrane IgG, but not IgM. Masat et al. (2000) suggested that SWAP70 is involved not only in nuclear events but also in signaling in B-cell activation. Shinohara et al. (2002) demonstrated that SWAP70 specifically binds phosphatidylinositol-

3,4,5-triphosphate. On stimulation by growth factors, cytoplasmic SWAP70, which is dependent on phosphoinositide-3-hydroxykinase but independent of Ras (see OMIM Ref. No. 190020), moved to cell membrane rearrangements known as ruffles. However, mutant SWAP70 lacking the ability to bind phosphatidylinositol-

3,4,5-triphosphate blocked membrane ruffling induced by epidermal growth factor (EGF; 131530) or platelet-derived growth factor (see OMIM Ref. No. 173430). SWAP70 shows low homology with Rac-guanine nucleotide exchange factors, and catalyzes phosphatidylinositol-

3,4,5-triphosphate-dependent guanine nucleotide exchange to Rac (see OMIM Ref. No. 602048).

SWAP70-deficient fibroblasts showed impaired membrane ruffling after stimulation with EGF, and failed to activate Rac fully. Shinohara et al. (2002) concluded that SWAP70 is a different type of Rac-GEF which, independently of Ras, transduces signals from tyrosine kinase receptors to Rac.

[39685] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[39686] Masat, L.; Caldwell, J.; Armstrong, R.; Khoshnevisan, H.; Jessberger, R.; Herndier, B.; Wabl, M.; Ferrick, D. : Associ-

ation of SWAP-70 with the B cell antigen receptor complex. Proc. Nat. Acad. Sci. 97: 2180-2184, 2000. ; and

[39687] Shinohara, M.; Terada, Y.; Iwamatsu, A.; Shinohara, A.; Mochizuki, N.; Higuchi, M.; Gotoh, Y.; Ihara, S.; Nagata, S.; Itoh, H.; Fukui, Y.; Jessberger, R. : SWAP-70 is a guanine-nucleot.

[39688] Further studies establishing the function and utilities of SWAP70 are found in John Hopkins OMIM database record ID 604762, and in cited publications numbered 7286-7290 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Adenylate Kinase 5 (AK5, Accession NM_012093) is another VGAM1090 host target gene. AK5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AK5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AK5 BINDING SITE, designated SEQ ID:14394, to the nucleotide sequence of VGAM1090 RNA, herein designated VGAM RNA, also designated SEQ ID:3801.

[39689] Another function of VGAM1090 is therefore inhibition of Adenylate Kinase 5 (AK5, Accession NM_012093). Accord-

ingly, utilities of VGAM1090 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AK5. CHRNA7 (cholinergic receptor, nicotinic, alpha polypeptide 7, exons 5–10) and FAM7A (family with sequence similarity 7A, exons A–E) Fusion (CHRFAM7A, Accession XM_170784) is another VGAM1090 host target gene. CHRFAM7A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CHRFAM7A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHRFAM7A BINDING SITE, designated SEQ ID:45553, to the nucleotide sequence of VGAM1090 RNA, herein designated VGAM RNA, also designated SEQ ID:3801.

[39690] Another function of VGAM1090 is therefore inhibition of CHRNA7 (cholinergic receptor, nicotinic, alpha polypeptide 7, exons 5–10) and FAM7A (family with sequence similarity 7A, exons A–E) Fusion (CHRFAM7A, Accession XM_170784). Accordingly, utilities of VGAM1090 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHRFAM7A. FLJ13215 (Accession NM_025004) is another VGAM1090 host target

gene. FLJ13215 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ13215, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13215 BINDING SITE, designated SEQ ID:24576, to the nucleotide sequence of VGAM1090 RNA, herein designated VGAM RNA, also designated SEQ ID:3801.

[39691] Another function of VGAM1090 is therefore inhibition of FLJ13215 (Accession NM_025004). Accordingly, utilities of VGAM1090 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13215. KIAA1430 (Accession XM_087593) is another VGAM1090 host target gene. KIAA1430 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1430, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1430 BINDING SITE, designated SEQ ID:39357, to the nucleotide sequence of VGAM1090 RNA, herein designated VGAM RNA, also designated SEQ ID:3801.

[39692] Another function of VGAM1090 is therefore inhibition of KIAA1430 (Accession XM_087593). Accordingly, utilities of VGAM1090 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1430. PRO2955 (Accession NM_018545) is another VGAM1090 host target gene. PRO2955 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRO2955, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO2955 BINDING SITE, designated SEQ ID:20620, to the nucleotide sequence of VGAM1090 RNA, herein designated VGAM RNA, also designated SEQ ID:3801.

[39693] Another function of VGAM1090 is therefore inhibition of PRO2955 (Accession NM_018545). Accordingly, utilities of VGAM1090 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO2955. LOC148014 (Accession XM_085999) is another VGAM1090 host target gene. LOC148014 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC148014, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148014 BINDING SITE, designated SEQ ID:38442, to the nucleotide sequence of VGAM1090 RNA, herein designated VGAM RNA, also designated SEQ ID:3801.

[39694] Another function of VGAM1090 is therefore inhibition of LOC148014 (Accession XM_085999). Accordingly, utilities of VGAM1090 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148014. LOC90917 (Accession XM_034861) is another VGAM1090 host target gene. LOC90917 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90917, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90917 BINDING SITE, designated SEQ ID:32165, to the nucleotide sequence of VGAM1090 RNA, herein designated VGAM RNA, also designated SEQ ID:3801.

[39695] Another function of VGAM1090 is therefore inhibition of LOC90917 (Accession XM_034861). Accordingly, utilities of VGAM1090 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC90917. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1091 (VGAM1091) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[39696] VGAM1091 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1091 was detected is described hereinabove with reference to Figs. 1–8.

[39697] VGAM1091 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Poinsettia Mosaic Virus. VGAM1091 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[39698] VGAM1091 gene encodes a VGAM1091 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1091 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1091 precursor RNA is designated SEQ ID:1077, and is provided hereinbelow with ref–

erence to the sequence listing part. Nucleotide sequence SEQ ID:1077 is located at position 854 relative to the genome of Poinsettia Mosaic Virus.

- [39699] VGAM1091 precursor RNA folds onto itself, forming VGAM1091 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [39700] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1091 folded precursor RNA into VGAM1091 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 65%) nucleotide sequence of VGAM1091 RNA is designated SEQ ID:3802, and is provided hereinbelow with reference to the sequence listing part.

[39701] VGAM1091 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1091 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1091 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[39702] VGAM1091 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1091 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1091 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1091 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM1091 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[39703] The complementary binding of VGAM1091 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1091 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1091 host target RNA into VGAM1091 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[39704] It is appreciated that VGAM1091 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1091 host target genes. The mRNA of each one of this plurality of VGAM1091 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1091 RNA, herein designated VGAM RNA, and which when bound by VGAM1091 RNA causes

inhibition of translation of respective one or more VGAM1091 host target proteins.

[39705] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1091 gene, herein designated VGAM GENE, on one or more VGAM1091 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[39706] It is yet further appreciated that a function of VGAM1091 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1091 include diagnosis, prevention and

treatment of viral infection by Poinsettia Mosaic Virus. Specific functions, and accordingly utilities, of VGAM1091 correlate with, and may be deduced from, the identity of the host target genes which VGAM1091 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[39707] Nucleotide sequences of the VGAM1091 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1091 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1091 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1091 are further described hereinbelow with reference to Table 1.

[39708] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1091 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1091 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[39709] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1091 gene, herein designated VGAM is inhibition of expression of VGAM1091 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM1091 correlate with, and may be deduced from, the identity of the target genes which VGAM1091 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[39710] MGC13057 (Accession NM_032321) is a VGAM1091 host target gene. MGC13057 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC13057, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC13057 BINDING SITE, designated SEQ ID:26125, to the nucleotide sequence of VGAM1091 RNA, herein designated VGAM RNA, also designated SEQ ID:3802.

[39711] A function of VGAM1091 is therefore inhibition of MGC13057 (Accession NM_032321). Accordingly, utilities of VGAM1091 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC13057. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1092 (VGAM1092) viral gene, which

modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[39712] VGAM1092 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1092 was detected is described hereinabove with reference to Figs. 1–8.

[39713] VGAM1092 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Poinsettia Mosaic Virus. VGAM1092 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[39714] VGAM1092 gene encodes a VGAM1092 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1092 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1092 precursor RNA is designated SEQ ID:1078, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1078 is located at position 92 relative to the genome of Poinsettia Mosaic Virus.

[39715] VGAM1092 precursor RNA folds onto itself, forming

VGAM1092 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[39716] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1092 folded precursor RNA into VGAM1092 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 51%) nucleotide sequence of VGAM1092 RNA is designated SEQ ID:3803, and is provided hereinbelow with reference to the sequence listing part.

[39717] VGAM1092 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1092 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1092 host target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[39718] VGAM1092 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1092 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1092 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1092 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1092 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example

only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[39719] The complementary binding of VGAM1092 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1092 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1092 host target RNA into VGAM1092 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[39720] It is appreciated that VGAM1092 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1092 host target genes. The mRNA of each one of this plurality of VGAM1092 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1092 RNA, herein designated VGAM RNA, and which when bound by VGAM1092 RNA causes inhibition of translation of respective one or more VGAM1092 host target proteins.

[39721] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM1092 gene, herein designated VGAM GENE, on one or more VGAM1092 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[39722] It is yet further appreciated that a function of VGAM1092 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1092 include diagnosis, prevention and treatment of viral infection by Poinsettia Mosaic Virus. Specific functions, and accordingly utilities, of VGAM1092 correlate with, and may be deduced from, the identity of the host target genes which VGAM1092 binds and in-

hibits, and the function of these host target genes, as elaborated hereinbelow.

[39723] Nucleotide sequences of the VGAM1092 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1092 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1092 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1092 are further described hereinbelow with reference to Table 1.

[39724] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1092 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1092 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[39725] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1092 gene, herein designated VGAM is inhibition of expression of VGAM1092 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1092 correlate with, and may be deduced from, the identity of the target genes which VGAM1092 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[39726] GRB2-associated Binding Protein 3 (GAB3, Accession NM_080612) is a VGAM1092 host target gene. GAB3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GAB3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GAB3 BINDING SITE, designated SEQ ID:27926, to the nucleotide sequence of VGAM1092 RNA, herein designated VGAM RNA, also designated SEQ ID:3803.

[39727] A function of VGAM1092 is therefore inhibition of GRB2-associated Binding Protein 3 (GAB3, Accession NM_080612). Accordingly, utilities of VGAM1092 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GAB3. LOC147093 (Accession XM_097184) is another VGAM1092 host target gene. LOC147093 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC147093, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147093 BINDING SITE, desig-

nated SEQ ID:40802, to the nucleotide sequence of VGAM1092 RNA, herein designated VGAM RNA, also designated SEQ ID:3803.

[39728] Another function of VGAM1092 is therefore inhibition of LOC147093 (Accession XM_097184). Accordingly, utilities of VGAM1092 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147093. LOC169943 (Accession XM_104687) is another VGAM1092 host target gene. LOC169943 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC169943, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC169943 BINDING SITE, designated SEQ ID:42184, to the nucleotide sequence of VGAM1092 RNA, herein designated VGAM RNA, also designated SEQ ID:3803.

[39729] Another function of VGAM1092 is therefore inhibition of LOC169943 (Accession XM_104687). Accordingly, utilities of VGAM1092 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC169943. LOC222128 (Accession XM_166560) is another VGAM1092 host target gene. LOC222128 BINDING

SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC222128, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222128 BINDING SITE, designated SEQ ID:44538, to the nucleotide sequence of VGAM1092 RNA, herein designated VGAM RNA, also designated SEQ ID:3803.

[39730] Another function of VGAM1092 is therefore inhibition of LOC222128 (Accession XM_166560). Accordingly, utilities of VGAM1092 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222128. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1093 (VGAM1093) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[39731] VGAM1093 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1093 was detected is described hereinabove with reference to Figs. 1-8.

[39732] VGAM1093 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Poinsettia Mosaic Virus. VGAM1093 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[39733] VGAM1093 gene encodes a VGAM1093 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1093 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1093 precursor RNA is designated SEQ ID:1079, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1079 is located at position 3299 relative to the genome of Poinsettia Mosaic Virus.

[39734] VGAM1093 precursor RNA folds onto itself, forming VGAM1093 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence

of the nucleotide sequence of the second half thereof.

[39735] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1093 folded precursor RNA into VGAM1093 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1093 RNA is designated SEQ ID:3804, and is provided hereinbelow with reference to the sequence listing part.

[39736] VGAM1093 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1093 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1093 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[39737] VGAM1093 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1093 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1093 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1093 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1093 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[39738] The complementary binding of VGAM1093 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1093 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM1093 host target RNA into VGAM1093 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[39739] It is appreciated that VGAM1093 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1093 host target genes. The mRNA of each one of this plurality of VGAM1093 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1093 RNA, herein designated VGAM RNA, and which when bound by VGAM1093 RNA causes inhibition of translation of respective one or more VGAM1093 host target proteins.

[39740] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1093 gene, herein designated VGAM GENE, on one or more VGAM1093 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[39741] It is yet further appreciated that a function of VGAM1093 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1093 include diagnosis, prevention and treatment of viral infection by Poinsettia Mosaic Virus. Specific functions, and accordingly utilities, of VGAM1093 correlate with, and may be deduced from, the identity of the host target genes which VGAM1093 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[39742] Nucleotide sequences of the VGAM1093 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1093 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1093 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM1093 are further described hereinbelow with reference to Table 1.

[39743] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1093 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1093 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[39744] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1093 gene, herein designated VGAM is inhibition of expression of VGAM1093 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1093 correlate with, and may be deduced from, the identity of the target genes which VGAM1093 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[39745] AF9Q34 (Accession NM_032552) is a VGAM1093 host target gene. AF9Q34 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AF9Q34, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of AF9Q34 BINDING SITE, designated SEQ ID:26274, to the nucleotide sequence of VGAM1093 RNA, herein designated VGAM RNA, also designated SEQ ID:3804.

[39746] A function of VGAM1093 is therefore inhibition of AF9Q34 (Accession NM_032552). Accordingly, utilities of VGAM1093 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AF9Q34. Chromosome 20 Open Reading Frame 54 (C20orf54, Accession NM_033409) is another VGAM1093 host target gene. C20orf54 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by C20orf54, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf54 BINDING SITE, designated SEQ ID:27228, to the nucleotide sequence of VGAM1093 RNA, herein designated VGAM RNA, also designated SEQ ID:3804.

[39747] Another function of VGAM1093 is therefore inhibition of Chromosome 20 Open Reading Frame 54 (C20orf54, Accession NM_033409). Accordingly, utilities of VGAM1093 include diagnosis, prevention and treatment of diseases

and clinical conditions associated with C20orf54.

FLJ20034 (Accession NM_017630) is another VGAM1093 host target gene. FLJ20034 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20034, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20034 BINDING SITE, designated SEQ ID:19134, to the nucleotide sequence of VGAM1093 RNA, herein designated VGAM RNA, also designated SEQ ID:3804.

[39748] Another function of VGAM1093 is therefore inhibition of FLJ20034 (Accession NM_017630). Accordingly, utilities of VGAM1093 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20034. KIAA0853 (Accession NM_015070) is another VGAM1093 host target gene. KIAA0853 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0853, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0853 BINDING SITE, designated SEQ ID:17438, to the

nucleotide sequence of VGAM1093 RNA, herein designated VGAM RNA, also designated SEQ ID:3804.

[39749] Another function of VGAM1093 is therefore inhibition of KIAA0853 (Accession NM_015070). Accordingly, utilities of VGAM1093 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0853. MGC13071 (Accession NM_032689) is another VGAM1093 host target gene. MGC13071 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC13071, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC13071 BINDING SITE, designated SEQ ID:26408, to the nucleotide sequence of VGAM1093 RNA, herein designated VGAM RNA, also designated SEQ ID:3804.

[39750] Another function of VGAM1093 is therefore inhibition of MGC13071 (Accession NM_032689). Accordingly, utilities of VGAM1093 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC13071. Neuronal Guanine Nucleotide Exchange Factor (NGEF, Accession XM_044799) is another VGAM1093 host target gene. NGEF BINDING SITE is HOST TARGET binding

site found in the 5` untranslated region of mRNA encoded by NGEF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NGEF BINDING SITE, designated SEQ ID:34278, to the nucleotide sequence of VGAM1093 RNA, herein designated VGAM RNA, also designated SEQ ID:3804.

[39751] Another function of VGAM1093 is therefore inhibition of Neuronal Guanine Nucleotide Exchange Factor (NGEF, Accession XM_044799). Accordingly, utilities of VGAM1093 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NGEF. Polymerase (RNA) II (DNA directed) Polypeptide D (POLR2D, Accession NM_004805) is another VGAM1093 host target gene. POLR2D BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by POLR2D, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of POLR2D BINDING SITE, designated SEQ ID:11227, to the nucleotide sequence of VGAM1093 RNA, herein designated VGAM RNA, also designated SEQ

ID:3804.

[39752] Another function of VGAM1093 is therefore inhibition of Polymerase (RNA) II (DNA directed) Polypeptide D (POLR2D, Accession NM_004805). Accordingly, utilities of VGAM1093 include diagnosis, prevention and treatment of diseases and clinical conditions associated with POLR2D. Wiskott–Aldrich Syndrome–like (WASL, Accession NM_003941) is another VGAM1093 host target gene. WASL BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by WASL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WASL BINDING SITE, designated SEQ ID:10051, to the nucleotide sequence of VGAM1093 RNA, herein designated VGAM RNA, also designated SEQ ID:3804.

[39753] Another function of VGAM1093 is therefore inhibition of Wiskott–Aldrich Syndrome–like (WASL, Accession NM_003941). Accordingly, utilities of VGAM1093 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WASL. LOC151512 (Accession XM_098072) is another VGAM1093 host target gene. LOC151512 BINDING SITE is HOST TARGET binding

site found in the 5` untranslated region of mRNA encoded by LOC151512, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151512 BINDING SITE, designated SEQ ID:41362, to the nucleotide sequence of VGAM1093 RNA, herein designated VGAM RNA, also designated SEQ ID:3804.

[39754] Another function of VGAM1093 is therefore inhibition of LOC151512 (Accession XM_098072). Accordingly, utilities of VGAM1093 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151512. LOC153277 (Accession XM_098346) is another VGAM1093 host target gene. LOC153277 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC153277, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153277 BINDING SITE, designated SEQ ID:41605, to the nucleotide sequence of VGAM1093 RNA, herein designated VGAM RNA, also designated SEQ ID:3804.

[39755] Another function of VGAM1093 is therefore inhibition of

LOC153277 (Accession XM_098346). Accordingly, utilities of VGAM1093 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153277. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1094 (VGAM1094) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[39756] VGAM1094 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1094 was detected is described hereinabove with reference to Figs. 1-8.

[39757] VGAM1094 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Poinsettia Mosaic Virus. VGAM1094 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[39758] VGAM1094 gene encodes a VGAM1094 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1094 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1094 precursor RNA is designated SEQ ID:1080, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1080 is located at position 5436 relative to the genome of Poinsettia Mosaic Virus.

[39759] VGAM1094 precursor RNA folds onto itself, forming VGAM1094 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence

of the nucleotide sequence of the second half thereof.

[39760] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1094 folded precursor RNA into VGAM1094 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1094 RNA is designated SEQ ID:3805, and is provided hereinbelow with reference to the sequence listing part.

[39761] VGAM1094 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1094 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1094 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[39762] VGAM1094 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1094 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1094 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1094 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1094 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[39763] The complementary binding of VGAM1094 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1094 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM1094 host target RNA into VGAM1094 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[39764] It is appreciated that VGAM1094 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1094 host target genes. The mRNA of each one of this plurality of VGAM1094 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1094 RNA, herein designated VGAM RNA, and which when bound by VGAM1094 RNA causes inhibition of translation of respective one or more VGAM1094 host target proteins.

[39765] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1094 gene, herein designated VGAM GENE, on one or more VGAM1094 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[39766] It is yet further appreciated that a function of VGAM1094 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1094 include diagnosis, prevention and treatment of viral infection by Poinsettia Mosaic Virus. Specific functions, and accordingly utilities, of VGAM1094 correlate with, and may be deduced from, the identity of the host target genes which VGAM1094 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[39767] Nucleotide sequences of the VGAM1094 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1094 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1094 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM1094 are further described hereinbelow with reference to Table 1.

[39768] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1094 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1094 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[39769] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1094 gene, herein designated VGAM is inhibition of expression of VGAM1094 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1094 correlate with, and may be deduced from, the identity of the target genes which VGAM1094 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[39770] LOC153937 (Accession XM_087813) is a VGAM1094 host target gene. LOC153937 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC153937, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of LOC153937 BINDING SITE, designated SEQ ID:39443, to the nucleotide sequence of VGAM1094 RNA, herein designated VGAM RNA, also designated SEQ ID:3805.

[39771] A function of VGAM1094 is therefore inhibition of LOC153937 (Accession XM_087813). Accordingly, utilities of VGAM1094 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153937. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1095 (VGAM1095) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[39772] VGAM1095 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1095 was detected is described hereinabove with reference to Figs. 1–8.

[39773] VGAM1095 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Poinsettia Mosaic Virus. VGAM1095 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[39774] VGAM1095 gene encodes a VGAM1095 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1095 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1095 precursor RNA is designated SEQ ID:1081, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1081 is located at position 973 relative to the genome of Poinsettia Mosaic Virus.

[39775] VGAM1095 precursor RNA folds onto itself, forming VGAM1095 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[39776] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1095 folded precursor RNA into VGAM1095 RNA, herein designated VGAM RNA, a single stranded ~22

nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 70%) nucleotide sequence of VGAM1095 RNA is designated SEQ ID:3806, and is provided hereinbelow with reference to the sequence listing part.

[39777] VGAM1095 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1095 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1095 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[39778] VGAM1095 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1095 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1095 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1095 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1095 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[39779] The complementary binding of VGAM1095 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1095 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1095 host target RNA into VGAM1095 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[39780] It is appreciated that VGAM1095 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1095 host target genes. The mRNA of each one of this plurality of VGAM1095 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1095 RNA, herein designated VGAM RNA, and which when bound by VGAM1095 RNA causes inhibition of translation of respective one or more VGAM1095 host target proteins.

[39781] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1095 gene, herein designated VGAM GENE, on one or more VGAM1095 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[39782] It is yet further appreciated that a function of VGAM1095 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1095 include diagnosis, prevention and treatment of viral infection by Poinsettia Mosaic Virus. Specific functions, and accordingly utilities, of VGAM1095 correlate with, and may be deduced from, the identity of the host target genes which VGAM1095 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[39783] Nucleotide sequences of the VGAM1095 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1095 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1095 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1095 are further described hereinbelow with reference to Table 1.

[39784] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM1095 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1095 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[39785] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1095 gene, herein designated VGAM is inhibition of expression of VGAM1095 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1095 correlate with, and may be deduced from, the identity of the target genes which VGAM1095 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[39786] Amiloride-sensitive Cation Channel 1, Neuronal (degenerin) (ACCN1, Accession NM_001094) is a VGAM1095 host target gene. ACCN1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ACCN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ACCN1 BINDING SITE, designated SEQ ID:6753, to the nucleotide sequence of VGAM1095 RNA, herein designated VGAM RNA,

also designated SEQ ID:3806.

[39787] A function of VGAM1095 is therefore inhibition of Amiloride-sensitive Cation Channel 1, Neuronal (degenerin) (ACCN1, Accession NM_001094), a gene which non-voltage-gated amiloride-sensitive cation channel permeable for sodium, potassium and lithium. Accordingly, utilities of VGAM1095 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ACCN1. The function of ACCN1 has been established by previous studies. Price et al. (1996) cloned a novel cDNA encoding a nonvoltage-dependent sodium channel from human brain, which they termed BNC1 for 'brain Na⁺ channel 1.' BNC1 has some sequence similarity to members of a family of amiloride-sensitive sodium channels that includes the mammalian epithelial Na⁺ channel (OMIM Ref. No. 600228). However, among other dissimilarities, BNC1 channel activity does not increase when it is coexpressed with other cloned subunits of the family. Thus, Price et al. (1996) considered BNC1 to be the first cloned member of a new subfamily of mammalian Na⁺ channels. Northern blot analysis revealed that the gene is expressed as 2.7- and 3.7-kb transcripts in brain and spinal cord tissues only. Price et al. (1996) sug-

gested that BNC1 may play a novel role in neurotransmission. Animal model experiments lend further support to the function of ACCN1. Price et al. (2000) generated mice deficient in Bnc1 by targeted disruption. Bnc1 $-/-$ mice had markedly reduced sensitivity of a specific component of mechanosensation: low-threshold rapidly adapting mechanoreceptors.

[39788] It is appreciated that the abovementioned animal model for ACCN1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[39789] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[39790] Price, M. P.; Snyder, P. M.; Welsh, M. J. : Cloning and expression of a novel human brain Na⁺ channel. J. Biol. Chem. 271: 7879–7882, 1996. ; and

[39791] Price, M. P.; Lewin, G. R.; McIlwrath, S. L.; Cheng, C.; Xie, J.; Heppenstall, P. A.; Stucky, C. L.; Mannsfeldt, A. G.; Brennan, T. J.; Drummond, H. A.; Qiao, J.; Benson, C. J.; Tarr, D.

[39792] Further studies establishing the function and utilities of ACCN1 are found in John Hopkins OMIM database record

ID 601784, and in cited publications numbered 1251–1255 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Dystroglycan 1 (dystrophin-associated glycoprotein 1) (DAG1, Accession NM_004393) is another VGAM1095 host target gene. DAG1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DAG1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DAG1 BINDING SITE, designated SEQ ID:10636, to the nucleotide sequence of VGAM1095 RNA, herein designated VGAM RNA, also designated SEQ ID:3806.

[39793] Another function of VGAM1095 is therefore inhibition of Dystroglycan 1 (dystrophin-associated glycoprotein 1) (DAG1, Accession NM_004393), a gene which may provide linkage between the sarcolemma and extracellular matrix (ECM). Accordingly, utilities of VGAM1095 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DAG1. The function of DAG1 has been established by previous studies. Ibraghimov-Beskrovnaya et al. (1992) demonstrated that the trans-

membrane 43-kD and extracellular 156-kD dystrophin (OMIM Ref. No. 300377)–associated glycoproteins are encoded by a single messenger RNA and that the extracellular 156-kD DAG binds laminin. Thus, the 156-kD DAG is a laminin-binding glycoprotein that may provide linkage between the sarcolemma and extracellular matrix (ECM). The dramatic reduction in the 156K DAG in Duchenne muscular dystrophy (OMIM Ref. No. 310200) led to a loss of linkage between the sarcolemma and extracellular matrix, rendering muscle fibers more susceptible to necrosis. Ibraghimov-Beskrovnaya et al. (1992, 1992, 1993) mapped the DAG gene to chromosome 3 by Southern blot analysis of human/Chinese hamster somatic cell hybrid DNAs. One hybrid cell line with an isochromosome 3q was negative, suggesting location of the gene on 3p. The regional assignment was confirmed and further refined by fluorescence in situ hybridization, the localization being 3p21. The coding sequence of the DAG1 gene is organized into 2 exons, separated by a large intron (Ibraghimov-Beskrovnaya et al., 1993). The predicted amino acid sequence of human and rabbit dystroglycan are 93% identical, with predicted glycosylation sites being conserved. Human dystroglycan is expressed in a variety

of fetal and adult tissues. The muscle and nonmuscle isoforms of dystroglycan differ by carbohydrate moieties but not protein sequence. Using PCR, immunohistochemistry, and immunoblotting to analyze samples from patients with Fukuyama congenital muscular dystrophy (FCMD; 253800), Hayashi et al. (2001) confirmed a deficiency of fukutin and found marked deficiency of highly glycosylated DAG1 in skeletal and cardiac muscle and reduced amounts of DAG1 in brain tissue. Beta-dystroglycan was normal in all tissues examined. These findings supported the suggestion that fukutin deficiency affects the modification of glycosylation of DAG1, which then cannot localize or function properly and may be degraded or eluted from the extracellular surface membrane of the muscle fiber. Hayashi et al. (2001) concluded that this disruption underlies the developmental, structural, and functional damage to muscles in patients with FCMD. Animal model experiments lend further support to the function of DAG1. Cohn et al. (2002) found that striated muscle-specific disruption of the *Dag1* gene in mice resulted in loss of the dystrophin-glycoprotein complex in differentiated muscle and a remarkably mild muscular dystrophy with hypertrophy and without tissue fibrosis. They found that satellite

cells, expressing dystroglycan, supported continued efficient regeneration of skeletal muscle along with transient expression of dystroglycan in regenerating muscle fibers. Cohn et al. (2002) demonstrated a similar phenomenon of reexpression of functional dystroglycan in regenerating muscle fibers in a mild form of human muscular dystrophy caused by disruption of posttranslational dystroglycan processing. They concluded that maintenance of regenerative capacity by satellite cells expressing dystroglycan is likely responsible for mild disease progression in mice and possibly humans. Cohn et al. (2002) suggested that inadequate repair of skeletal muscle by satellite cells represents an important mechanism affecting the pathogenesis of muscular dystrophy.

[39794] It is appreciated that the abovementioned animal model for DAG1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[39795] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[39796] Ibraghimov-Beskrovnaya, O.; Ervasti, J. M.; Leveille, C. J.; Slaughter, C. A.; Sernett, S. W.; Campbell, K. P. : Primary

structure of dystrophin-associated glycoproteins linking dystrophin to the extracellular matrix. Nature 355: 696–702, 1992. ; and

[39797] Hayashi, Y. K.; Ogawa, M.; Tagawa, K.; Noguchi, S.; Ishihara, T.; Nonaka, I.; Arahata, K. : Selective deficiency of alpha-dystroglycan in Fukuyama-type congenital muscular dystrophy. N.

[39798] Further studies establishing the function and utilities of DAG1 are found in John Hopkins OMIM database record ID 128239, and in cited publications numbered 4568–4570, 4604, 4615–4628, 4612–4613, 4608–461 and 4614 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. FYVE and Coiled-coil Domain Containing 1 (FYCO1, Accession NM_024513) is another VGAM1095 host target gene. FYCO1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FYCO1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FYCO1 BINDING SITE, designated SEQ ID:23714, to the nucleotide sequence of VGAM1095 RNA, herein designated VGAM RNA, also designated SEQ ID:3806.

[39799] Another function of VGAM1095 is therefore inhibition of FYVE and Coiled-coil Domain Containing 1 (FYCO1, Accession NM_024513). Accordingly, utilities of VGAM1095 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FYCO1. SEPT6 (Accession NM_015129) is another VGAM1095 host target gene. SEPT6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SEPT6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEPT6 BINDING SITE, designated SEQ ID:17494, to the nucleotide sequence of VGAM1095 RNA, herein designated VGAM RNA, also designated SEQ ID:3806.

[39800] Another function of VGAM1095 is therefore inhibition of SEPT6 (Accession NM_015129). Accordingly, utilities of VGAM1095 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEPT6. LOC91445 (Accession XM_018516) is another VGAM1095 host target gene. LOC91445 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91445, corresponding to a HOST

TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91445 BINDING SITE, designated SEQ ID:30371, to the nucleotide sequence of VGAM1095 RNA, herein designated VGAM RNA, also designated SEQ ID:3806.

[39801] Another function of VGAM1095 is therefore inhibition of LOC91445 (Accession XM_018516). Accordingly, utilities of VGAM1095 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91445. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1096 (VGAM1096) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[39802] VGAM1096 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1096 was detected is described hereinabove with reference to Figs. 1-8.

[39803] VGAM1096 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Strawberry Mottle Virus.

VGAM1096 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[39804] VGAM1096 gene encodes a VGAM1096 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1096 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1096 precursor RNA is designated SEQ ID:1082, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1082 is located at position 4444 relative to the genome of Strawberry Mottle Virus.

[39805] VGAM1096 precursor RNA folds onto itself, forming VGAM1096 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[39806] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM1096 folded precursor RNA into VGAM1096 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1096 RNA is designated SEQ ID:3807, and is provided hereinbelow with reference to the sequence listing part.

[39807] VGAM1096 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1096 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1096 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[39808] VGAM1096 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1096 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM1096 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1096 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1096 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[39809] The complementary binding of VGAM1096 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1096 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1096 host target RNA into VGAM1096 host target protein,

herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[39810] It is appreciated that VGAM1096 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1096 host target genes. The mRNA of each one of this plurality of VGAM1096 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1096 RNA, herein designated VGAM RNA, and which when bound by VGAM1096 RNA causes inhibition of translation of respective one or more VGAM1096 host target proteins.

[39811] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1096 gene, herein designated VGAM GENE, on one or more VGAM1096 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[39812] It is yet further appreciated that a function of VGAM1096 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1096 include diagnosis, prevention and treatment of viral infection by Strawberry Mottle Virus. Specific functions, and accordingly utilities, of VGAM1096 correlate with, and may be deduced from, the identity of the host target genes which VGAM1096 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[39813] Nucleotide sequences of the VGAM1096 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1096 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1096 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1096 are further described hereinbelow with reference to Table 1.

[39814] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1096 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1096 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[39815] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1096 gene, herein designated VGAM is inhibition of expression of VGAM1096 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1096 correlate with, and may be deduced from, the identity of the target genes which VGAM1096 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[39816] ADP-ribosylation Factor 1 (ARF1, Accession XM_047545) is a VGAM1096 host target gene. ARF1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ARF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARF1 BINDING SITE, designated SEQ ID:34994, to the nucleotide se-

quence of VGAM1096 RNA, herein designated VGAM RNA, also designated SEQ ID:3807.

[39817] A function of VGAM1096 is therefore inhibition of ADP-ribosylation Factor 1 (ARF1, Accession XM_047545). Accordingly, utilities of VGAM1096 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARF1. Chromodomain Helicase DNA Binding Protein 2 (CHD2, Accession NM_001271) is another VGAM1096 host target gene. CHD2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CHD2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHD2 BINDING SITE, designated SEQ ID:6934, to the nucleotide sequence of VGAM1096 RNA, herein designated VGAM RNA, also designated SEQ ID:3807.

[39818] Another function of VGAM1096 is therefore inhibition of Chromodomain Helicase DNA Binding Protein 2 (CHD2, Accession NM_001271). Accordingly, utilities of VGAM1096 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHD2. Integrin, Alpha 4 (antigen CD49D, alpha 4 subunit of VLA-

4 receptor) (ITGA4, Accession NM_000885) is another VGAM1096 host target gene. ITGA4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ITGA4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITGA4 BINDING SITE, designated SEQ ID:6584, to the nucleotide sequence of VGAM1096 RNA, herein designated VGAM RNA, also designated SEQ ID:3807.

[39819] Another function of VGAM1096 is therefore inhibition of Integrin, Alpha 4 (antigen CD49D, alpha 4 subunit of VLA-4 receptor) (ITGA4, Accession NM_000885), a gene which recognizes one or more domains within the alternatively spliced cs-1 and cs-5 regions of fibronectin. Accordingly, utilities of VGAM1096 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITGA4. The function of ITGA4 has been established by previous studies. integrin family includes cell surface receptors for extracellular matrix components as well as receptors involved in various aspects of leukocyte adhesion. The integrins generally consist of alpha-beta heterodimeric transmembrane glycoproteins in which the al-

pha subunit is noncovalently associated with the beta subunit. Three major subfamilies of integrins have been defined, each containing a common beta subunit that can be associated with multiple alpha subunits. Two sets of integrins have been reported on lymphoid and myeloid cells. The first set, including LFA-1 (see OMIM Ref. No. 153370), Mac-1 (OMIM Ref. No. 120980), and p150,95 (OMIM Ref. No. 151510), represents the molecules that are exclusively expressed on leukocytes. The second set, the VLA antigens, are not restricted to leukocytes because nearly all of the cell types, except granulocytes and red blood cells, express them. They consist of at least 6 different chains that can associate with the same beta-1 subunit. These complexes are mainly involved in cell-matrix adhesive interactions. Within the VLA family, VLA4 is atypical because it participates not only in extracellular matrix adhesion as receptor for fibronectin but also as cell-cell adhesion receptor. Lu and Cyster (2002) studied the mechanisms that control localization of marginal zone B cells. They demonstrated that marginal zone B cells express elevated levels of the integrins LFA1 and alpha-4-beta-1 (see OMIM Ref. No. 135630), and that the marginal zone B cells bind to the ligands ICAM1 (OMIM

Ref. No. 147840) and VCAM1 (OMIM Ref. No. 192225).

These ligands are expressed within the marginal zone in a lymphotoxin-dependent manner. Combined inhibition of LFA1 and alpha-4-beta-1 causes a rapid and selective release of B cells from the marginal zone. Furthermore, lipopolysaccharide-triggered marginal zone B cell relocalization involves downregulation of integrin-mediated adhesion. Lu and Cyster (2002) concluded that their studies identified key requirements for marginal zone B cell localization and established a role for integrins in peripheral lymphoid tissue compartmentalization.

[39820] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[39821] Lu, T. T.; Cyster, J. G. : Integrin-mediated long-term B cell retention in the splenic marginal zone. *Science* 297: 409-412, 2002. ; and

[39822] Cunningham, S. A.; Rodriguez, J. M.; Arrate, M. P.; Tran, T. M.; Brock, T. A. : JAM2 interacts with alpha-4/beta-1: facilitation by JAM3. *J. Biol. Chem.* 277: 27589-27592, 2002.

[39823] Further studies establishing the function and utilities of ITGA4 are found in John Hopkins OMIM database record

ID 192975, and in cited publications numbered 1001 and 10017–10018 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. KIAA1319 (Accession NM_020770) is another VGAM1096 host target gene. KIAA1319 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1319, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1319 BINDING SITE, designated SEQ ID:21869, to the nucleotide sequence of VGAM1096 RNA, herein designated VGAM RNA, also designated SEQ ID:3807.

[39824] Another function of VGAM1096 is therefore inhibition of KIAA1319 (Accession NM_020770). Accordingly, utilities of VGAM1096 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1319. KIAA1361 (Accession XM_030845) is another VGAM1096 host target gene. KIAA1361 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1361, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA1361 BINDING SITE, designated SEQ ID:31171, to the nucleotide sequence of VGAM1096 RNA, herein designated VGAM RNA, also designated SEQ ID:3807.

[39825] Another function of VGAM1096 is therefore inhibition of KIAA1361 (Accession XM_030845). Accordingly, utilities of VGAM1096 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1361. SH3 Domain Binding Glutamic Acid-rich Protein Like 2 (SH3BGRL2, Accession NM_031469) is another VGAM1096 host target gene. SH3BGRL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SH3BGRL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SH3BGRL2 BINDING SITE, designated SEQ ID:25533, to the nucleotide sequence of VGAM1096 RNA, herein designated VGAM RNA, also designated SEQ ID:3807.

[39826] Another function of VGAM1096 is therefore inhibition of SH3 Domain Binding Glutamic Acid-rich Protein Like 2 (SH3BGRL2, Accession NM_031469). Accordingly, utilities of VGAM1096 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with SH3BGRL2. LOC152008 (Accession XM_087363) is another VGAM1096 host target gene. LOC152008 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC152008, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152008 BINDING SITE, designated SEQ ID:39197, to the nucleotide sequence of VGAM1096 RNA, herein designated VGAM RNA, also designated SEQ ID:3807.

[39827] Another function of VGAM1096 is therefore inhibition of LOC152008 (Accession XM_087363). Accordingly, utilities of VGAM1096 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152008. LOC57826 (Accession NM_021183) is another VGAM1096 host target gene. LOC57826 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC57826, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC57826 BINDING SITE, designated SEQ ID:22159, to the

nucleotide sequence of VGAM1096 RNA, herein designated VGAM RNA, also designated SEQ ID:3807.

[39828] Another function of VGAM1096 is therefore inhibition of LOC57826 (Accession NM_021183). Accordingly, utilities of VGAM1096 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC57826. LOC90333 (Accession XM_030958) is another VGAM1096 host target gene. LOC90333 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90333, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90333 BINDING SITE, designated SEQ ID:31220, to the nucleotide sequence of VGAM1096 RNA, herein designated VGAM RNA, also designated SEQ ID:3807.

[39829] Another function of VGAM1096 is therefore inhibition of LOC90333 (Accession XM_030958). Accordingly, utilities of VGAM1096 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90333. LOC90982 (Accession XM_035332) is another VGAM1096 host target gene. LOC90982 BINDING SITE is HOST TARGET binding site found in the 5' untranslated

region of mRNA encoded by LOC90982, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90982 BINDING SITE, designated SEQ ID:32234, to the nucleotide sequence of VGAM1096 RNA, herein designated VGAM RNA, also designated SEQ ID:3807.

[39830] Another function of VGAM1096 is therefore inhibition of LOC90982 (Accession XM_035332). Accordingly, utilities of VGAM1096 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90982. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1097 (VGAM1097) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[39831] VGAM1097 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1097 was detected is described hereinabove with reference to Figs. 1-8.

[39832] VGAM1097 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Strawberry Mottle Virus. VGAM1097 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[39833] VGAM1097 gene encodes a VGAM1097 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1097 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1097 precursor RNA is designated SEQ ID:1083, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1083 is located at position 5799 relative to the genome of Strawberry Mottle Virus.

[39834] VGAM1097 precursor RNA folds onto itself, forming VGAM1097 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[39835] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1097 folded precursor RNA into VGAM1097 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM1097 RNA is designated SEQ ID:3808, and is provided hereinbelow with reference to the sequence listing part.

[39836] VGAM1097 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1097 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1097 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[39837] VGAM1097 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1097 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM1097 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1097 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1097 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[39838] The complementary binding of VGAM1097 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1097 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1097

host target RNA into VGAM1097 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[39839] It is appreciated that VGAM1097 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1097 host target genes. The mRNA of each one of this plurality of VGAM1097 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1097 RNA, herein designated VGAM RNA, and which when bound by VGAM1097 RNA causes inhibition of translation of respective one or more VGAM1097 host target proteins.

[39840] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1097 gene, herein designated VGAM GENE, on one or more VGAM1097 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[39841] It is yet further appreciated that a function of VGAM1097 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1097 include diagnosis, prevention and treatment of viral infection by Strawberry Mottle Virus. Specific functions, and accordingly utilities, of VGAM1097 correlate with, and may be deduced from, the identity of the host target genes which VGAM1097 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[39842] Nucleotide sequences of the VGAM1097 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1097 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1097 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1097 are further

described hereinbelow with reference to Table 1.

[39843] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1097 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1097 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[39844] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1097 gene, herein designated VGAM is inhibition of expression of VGAM1097 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1097 correlate with, and may be deduced from, the identity of the target genes which VGAM1097 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[39845] AAT1 (Accession XM_087415) is a VGAM1097 host target gene. AAT1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AAT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AAT1 BINDING SITE, designated SEQ ID:39228,

to the nucleotide sequence of VGAM1097 RNA, herein designated VGAM RNA, also designated SEQ ID:3808.

[39846] A function of VGAM1097 is therefore inhibition of AAT1 (Accession XM_087415), a gene which linkage between A1BG and Lutheran blood group . Accordingly, utilities of VGAM1097 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AAT1. The function of AAT1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM357.ACP33 (Accession NM_016630) is another VGAM1097 host target gene. ACP33 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ACP33, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ACP33 BINDING SITE, designated SEQ ID:18745, to the nucleotide sequence of VGAM1097 RNA, herein designated VGAM RNA, also designated SEQ ID:3808.

[39847] Another function of VGAM1097 is therefore inhibition of ACP33 (Accession NM_016630). Accordingly, utilities of VGAM1097 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with ACP33. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1098 (VGAM1098) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[39848] VGAM1098 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1098 was detected is described hereinabove with reference to Figs. 1–8.

[39849] VGAM1098 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Strawberry Mottle Virus. VGAM1098 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[39850] VGAM1098 gene encodes a VGAM1098 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1098 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1098 precursor RNA is designated SEQ ID:1084, and is provided hereinbelow with ref–

erence to the sequence listing part. Nucleotide sequence SEQ ID:1084 is located at position 4573 relative to the genome of Strawberry Mottle Virus.

- [39851] VGAM1098 precursor RNA folds onto itself, forming VGAM1098 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [39852] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1098 folded precursor RNA into VGAM1098 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 65%) nucleotide sequence of VGAM1098 RNA is designated SEQ ID:3809, and is provided hereinbelow with reference to the sequence listing part.

[39853] VGAM1098 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1098 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1098 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[39854] VGAM1098 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1098 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1098 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1098 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM1098 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[39855] The complementary binding of VGAM1098 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1098 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1098 host target RNA into VGAM1098 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[39856] It is appreciated that VGAM1098 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1098 host target genes. The mRNA of each one of this plurality of VGAM1098 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1098 RNA, herein designated VGAM RNA, and which when bound by VGAM1098 RNA causes

inhibition of translation of respective one or more VGAM1098 host target proteins.

[39857] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1098 gene, herein designated VGAM GENE, on one or more VGAM1098 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[39858] It is yet further appreciated that a function of VGAM1098 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1098 include diagnosis, prevention and

treatment of viral infection by Strawberry Mottle Virus. Specific functions, and accordingly utilities, of VGAM1098 correlate with, and may be deduced from, the identity of the host target genes which VGAM1098 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[39859] Nucleotide sequences of the VGAM1098 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1098 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1098 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1098 are further described hereinbelow with reference to Table 1.

[39860] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1098 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1098 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[39861] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1098 gene, herein designated VGAM is inhibition of expression of VGAM1098 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM1098 correlate with, and may be deduced from, the identity of the target genes which VGAM1098 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[39862] Aryl-hydrocarbon Receptor Nuclear Translocator 2 (ARNT2, Accession NM_014862) is a VGAM1098 host target gene. ARNT2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ARNT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARNT2 BINDING SITE, designated SEQ ID:16938, to the nucleotide sequence of VGAM1098 RNA, herein designated VGAM RNA, also designated SEQ ID:3809.

[39863] A function of VGAM1098 is therefore inhibition of Aryl-hydrocarbon Receptor Nuclear Translocator 2 (ARNT2, Accession NM_014862), a gene which specifically recognizes the xenobiotic response element (xre). Accordingly, utilities of VGAM1098 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARNT2. The function of ARNT2 and its association

with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM345. Solute Carrier Family 14 (urea transporter), Member 2 (SLC14A2, Accession NM_007163) is another VGAM1098 host target gene. SLC14A2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SLC14A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC14A2 BINDING SITE, designated SEQ ID:14010, to the nucleotide sequence of VGAM1098 RNA, herein designated VGAM RNA, also designated SEQ ID:3809.

[39864] Another function of VGAM1098 is therefore inhibition of Solute Carrier Family 14 (urea transporter), Member 2 (SLC14A2, Accession NM_007163), a gene which is a renal urea transporter 2. Accordingly, utilities of VGAM1098 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC14A2. The function of SLC14A2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM74. Solute Carrier Family 6 (neurotransmitter trans-

porter, creatine), Member 8 (SLC6A8, Accession NM_005629) is another VGAM1098 host target gene. SLC6A8 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SLC6A8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC6A8 BINDING SITE, designated SEQ ID:12149, to the nucleotide sequence of VGAM1098 RNA, herein designated VGAM RNA, also designated SEQ ID:3809.

[39865] Another function of VGAM1098 is therefore inhibition of Solute Carrier Family 6 (neurotransmitter transporter, creatine), Member 8 (SLC6A8, Accession NM_005629). Accordingly, utilities of VGAM1098 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC6A8. T-cell Lymphoma Invasion and Metastasis 1 (TIAM1, Accession NM_003253) is another VGAM1098 host target gene. TIAM1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by TIAM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of TIAM1 BINDING SITE, designated SEQ ID:9260, to the nucleotide sequence of VGAM1098 RNA, herein designated VGAM RNA, also designated SEQ ID:3809.

[39866] Another function of VGAM1098 is therefore inhibition of T-cell Lymphoma Invasion and Metastasis 1 (TIAM1, Accession NM_003253), a gene which modulates the activity of Rho-like proteins and connects extracellular signals to cytoskeletal activities. Accordingly, utilities of VGAM1098 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TIAM1. The function of TIAM1 has been established by previous studies. To identify genes involved in metastasis by insertional mutagenesis, Habets et al. (1994) infected mouse BW5147 T-lymphoma cells with Moloney murine leukemia virus, resulting in 5 to 20 proviral insertions per cell. By this 'proviral tagging' method, invasive variants were selected on monolayers of fibroblasts. Disrupting proviral insertions were found in these cells within the coding exons of a gene designated Tiam1 (T-cell lymphoma invasion and metastasis-1). Selected clones were also metastatic in nude mice, and transfection of a truncated Tiam1 cDNA into noninvasive cells transmitted the invasive phenotype.

Northern blot analysis demonstrated highest expression in the brain and testis. The mouse cDNA was isolated from a brain library and shown to encode a 1,591-amino acid protein which is serine rich and has regions of similarity to the Dbl-homologous (DH) domain found in GDP-GTP exchangers. The protein sequence also contains a pleckstrin-homologous (PH) domain thought to be involved in protein-protein interactions. Habets et al. (1995) cloned the human TIAM1 cDNA from a brain library using the mouse cDNA as a probe. The human protein is 95% identical to the mouse homolog. The authors speculated that TIAM1 may function in cellular signaling by activation of a Rho-like GTPase that regulates the cytoskeletal organization. Animal model experiments lend further support to the function of TIAM1. Malliri et al. (2002) generated mice lacking Tiam1 and demonstrated that Tiam1 $-/-$ mice are resistant to the development of RAS-induced skin tumors initiated with 7,12-dimethylbenzanthracene and promoted with 12-O-tetradecanoylphorbol-13-acetate. Moreover, the few tumors produced in Tiam1 $-/-$ mice grew much slower than did tumors in wildtype mice. Tiam1-deficient primary embryonic fibroblasts were also resistant to

Ras(V12)–induced focus formation. Analysis of Tiam1 heterozygotes indicated that both tumor initiation and promotion were dependent on the TIAM1 gene dose. Tiam1 deficiency was associated with increased apoptosis during initiation and with impeded proliferation during promotion. Although the number of tumors in Tiam1 $-/-$ mice was small, a greater proportion progressed to malignancy, suggesting that Tiam1 deficiency promotes malignant conversion. Malliri et al. (2002) concluded that their studies identified RAC activator TIAM1 as a critical regulator of different aspects of Ras–induced tumor formation.

[39867] It is appreciated that the abovementioned animal model for TIAM1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[39868] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[39869] Habets, G. G. M.; Scholtes, E. H. M.; Zuydgeest, D.; van der Kammen, R. A.; Stam, J. C.; Berns, A.; Collard, J. G. : Identification of an invasion–inducing gene, Tiam–1, that encodes a protein with homology to GDP–GTP exchangers for Rho–like proteins. Cell 77: 537–549, 1994. ; and

[39870] Malliri, A.; van der Kammen, R. A.; Clark, K.; van der Valk, M.; Michiels, F.; Collard, J. G. : Mice deficient in the Rac activator Tiam1 are resistant to Ras-induced skin tumours. *Natur.*

[39871] Further studies establishing the function and utilities of TIAM1 are found in John Hopkins OMIM database record ID 600687, and in cited publications numbered 9976–9980 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.ESDN (Accession NM_080927) is another VGAM1098 host target gene. ESDN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ESDN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ESDN BINDING SITE, designated SEQ ID:28155, to the nucleotide sequence of VGAM1098 RNA, herein designated VGAM RNA, also designated SEQ ID:3809.

[39872] Another function of VGAM1098 is therefore inhibition of ESDN (Accession NM_080927). Accordingly, utilities of VGAM1098 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ESDN. LIN-28 (Accession NM_024674) is another VGAM1098

host target gene. LIN-28 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LIN-28, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LIN-28 BINDING SITE, designated SEQ ID:23980, to the nucleotide sequence of VGAM1098 RNA, herein designated VGAM RNA, also designated SEQ ID:3809.

[39873] Another function of VGAM1098 is therefore inhibition of LIN-28 (Accession NM_024674). Accordingly, utilities of VGAM1098 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LIN-28. Syntrophin (SNPH, Accession NM_014723) is another VGAM1098 host target gene. SNPH BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SNPH, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SNPH BINDING SITE, designated SEQ ID:16303, to the nucleotide sequence of VGAM1098 RNA, herein designated VGAM RNA, also designated SEQ ID:3809.

[39874] Another function of VGAM1098 is therefore inhibition of Syntaphilin (SNPH, Accession NM_014723). Accordingly, utilities of VGAM1098 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNPH. LOC146488 (Accession XM_047748) is another VGAM1098 host target gene. LOC146488 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146488, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146488 BINDING SITE, designated SEQ ID:35045, to the nucleotide sequence of VGAM1098 RNA, herein designated VGAM RNA, also designated SEQ ID:3809.

[39875] Another function of VGAM1098 is therefore inhibition of LOC146488 (Accession XM_047748). Accordingly, utilities of VGAM1098 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146488. LOC147229 (Accession XM_085742) is another VGAM1098 host target gene. LOC147229 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC147229, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147229 BINDING SITE, designated SEQ ID:38318, to the nucleotide sequence of VGAM1098 RNA, herein designated VGAM RNA, also designated SEQ ID:3809.

[39876] Another function of VGAM1098 is therefore inhibition of LOC147229 (Accession XM_085742). Accordingly, utilities of VGAM1098 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147229. LOC200942 (Accession XM_114323) is another VGAM1098 host target gene. LOC200942 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC200942, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200942 BINDING SITE, designated SEQ ID:42871, to the nucleotide sequence of VGAM1098 RNA, herein designated VGAM RNA, also designated SEQ ID:3809.

[39877] Another function of VGAM1098 is therefore inhibition of LOC200942 (Accession XM_114323). Accordingly, utilities of VGAM1098 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC200942. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1099 (VGAM1099) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[39878] VGAM1099 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1099 was detected is described hereinabove with reference to Figs. 1–8.

[39879] VGAM1099 gene, herein designated VGAM GENE, is a viral gene contained in the genome of African Swine Fever Virus. VGAM1099 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[39880] VGAM1099 gene encodes a VGAM1099 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1099 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1099 precursor RNA is designated SEQ ID:1085, and is provided hereinbelow with ref–

erence to the sequence listing part. Nucleotide sequence SEQ ID:1085 is located at position 122281 relative to the genome of African Swine Fever Virus.

- [39881] VGAM1099 precursor RNA folds onto itself, forming VGAM1099 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [39882] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1099 folded precursor RNA into VGAM1099 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM1099 RNA is designated SEQ ID:3810, and is provided hereinbelow with reference to the sequence listing part.

[39883] VGAM1099 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1099 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1099 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[39884] VGAM1099 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1099 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1099 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1099 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM1099 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[39885] The complementary binding of VGAM1099 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1099 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1099 host target RNA into VGAM1099 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[39886] It is appreciated that VGAM1099 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1099 host target genes. The mRNA of each one of this plurality of VGAM1099 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1099 RNA, herein designated VGAM RNA, and which when bound by VGAM1099 RNA causes

inhibition of translation of respective one or more VGAM1099 host target proteins.

[39887] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1099 gene, herein designated VGAM GENE, on one or more VGAM1099 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[39888] It is yet further appreciated that a function of VGAM1099 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1099 include diagnosis, prevention and

treatment of viral infection by African Swine Fever Virus. Specific functions, and accordingly utilities, of VGAM1099 correlate with, and may be deduced from, the identity of the host target genes which VGAM1099 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[39889] Nucleotide sequences of the VGAM1099 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1099 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1099 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1099 are further described hereinbelow with reference to Table 1.

[39890] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1099 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1099 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[39891] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1099 gene, herein designated VGAM is inhibition of expression of VGAM1099 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM1099 correlate with, and may be deduced from, the identity of the target genes which VGAM1099 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[39892] Eukaryotic Translation Initiation Factor 1A (EIF1A, Accession XM_114147) is a VGAM1099 host target gene. EIF1A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EIF1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EIF1A BINDING SITE, designated SEQ ID:42722, to the nucleotide sequence of VGAM1099 RNA, herein designated VGAM RNA, also designated SEQ ID:3810.

[39893] A function of VGAM1099 is therefore inhibition of Eukaryotic Translation Initiation Factor 1A (EIF1A, Accession XM_114147), a gene which seems to be required for maximal rate of protein biosynthesis. Accordingly, utilities of VGAM1099 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EIF1A. The function of EIF1A and its association with various diseases and clinical conditions, has been established by

previous studies, as described hereinabove with reference to VGAM120.V-myb Myeloblastosis Viral Oncogene Homolog (avian) (MYB, Accession XM_004256) is another VGAM1099 host target gene. MYB BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MYB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MYB BINDING SITE, designated SEQ ID:29943, to the nucleotide sequence of VGAM1099 RNA, herein designated VGAM RNA, also designated SEQ ID:3810.

[39894] Another function of VGAM1099 is therefore inhibition of V-myb Myeloblastosis Viral Oncogene Homolog (avian) (MYB, Accession XM_004256). Accordingly, utilities of VGAM1099 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MYB. MGC20253 (Accession NM_144583) is another VGAM1099 host target gene. MGC20253 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC20253, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of MGC20253 BINDING SITE, designated SEQ ID:29395, to the nucleotide sequence of VGAM1099 RNA, herein designated VGAM RNA, also designated SEQ ID:3810.

[39895] Another function of VGAM1099 is therefore inhibition of MGC20253 (Accession NM_144583). Accordingly, utilities of VGAM1099 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC20253. Serine/threonine Kinase 38 Like (STK38L, Accession XM_044823) is another VGAM1099 host target gene. STK38L BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by STK38L, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STK38L BINDING SITE, designated SEQ ID:34289, to the nucleotide sequence of VGAM1099 RNA, herein designated VGAM RNA, also designated SEQ ID:3810.

[39896] Another function of VGAM1099 is therefore inhibition of Serine/threonine Kinase 38 Like (STK38L, Accession XM_044823). Accordingly, utilities of VGAM1099 include diagnosis, prevention and treatment of diseases and clinical

cal conditions associated with STK38L. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1100 (VGAM1100) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[39897] VGAM1100 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1100 was detected is described hereinabove with reference to Figs. 1–8.

[39898] VGAM1100 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Strawberry Mottle Virus. VGAM1100 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[39899] VGAM1100 gene encodes a VGAM1100 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1100 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1100 precursor RNA is designated SEQ ID:1086, and is provided hereinbelow with ref–

erence to the sequence listing part. Nucleotide sequence SEQ ID:1086 is located at position 5104 relative to the genome of Strawberry Mottle Virus.

- [39900] VGAM1100 precursor RNA folds onto itself, forming VGAM1100 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [39901] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1100 folded precursor RNA into VGAM1100 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 57%) nucleotide sequence of VGAM1100 RNA is designated SEQ ID:3811, and is provided hereinbelow with reference to the sequence listing part.

[39902] VGAM1100 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1100 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1100 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[39903] VGAM1100 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1100 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1100 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1100 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM1100 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[39904] The complementary binding of VGAM1100 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1100 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1100 host target RNA into VGAM1100 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[39905] It is appreciated that VGAM1100 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1100 host target genes. The mRNA of each one of this plurality of VGAM1100 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1100 RNA, herein designated VGAM RNA, and which when bound by VGAM1100 RNA causes

inhibition of translation of respective one or more VGAM1100 host target proteins.

[39906] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1100 gene, herein designated VGAM GENE, on one or more VGAM1100 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[39907] It is yet further appreciated that a function of VGAM1100 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1100 include diagnosis, prevention and

treatment of viral infection by Strawberry Mottle Virus. Specific functions, and accordingly utilities, of VGAM1100 correlate with, and may be deduced from, the identity of the host target genes which VGAM1100 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[39908] Nucleotide sequences of the VGAM1100 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1100 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1100 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1100 are further described hereinbelow with reference to Table 1.

[39909] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1100 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1100 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[39910] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1100 gene, herein designated VGAM is inhibition of expression of VGAM1100 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM1100 correlate with, and may be deduced from, the identity of the target genes which VGAM1100 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[39911] Engrailed Homolog 2 (EN2, Accession NM_001427) is a VGAM1100 host target gene. EN2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EN2 BINDING SITE, designated SEQ ID:7143, to the nucleotide sequence of VGAM1100 RNA, herein designated VGAM RNA, also designated SEQ ID:3811.

[39912] A function of VGAM1100 is therefore inhibition of Engrailed Homolog 2 (EN2, Accession NM_001427), a gene which may be required for normal cerebellar development; a homeobox protein, very strongly similar to murine En2. Accordingly, utilities of VGAM1100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EN2. The function of EN2 and its association with various diseases and clinical conditions, has

been established by previous studies, as described hereinabove with reference to VGAM232.SMG1 (Accession NM_015092) is another VGAM1100 host target gene. SMG1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SMG1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SMG1 BINDING SITE, designated SEQ ID:17482, to the nucleotide sequence of VGAM1100 RNA, herein designated VGAM RNA, also designated SEQ ID:3811.

[39913] Another function of VGAM1100 is therefore inhibition of SMG1 (Accession NM_015092), a gene which acts as the target for the cell-cycle arrest and immunosuppressive effects. Accordingly, utilities of VGAM1100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMG1. The function of SMG1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM419.FKSG42 (Accession NM_032032) is another VGAM1100 host target gene. FKSG42 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by

FKSG42, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FKSG42 BINDING SITE, designated SEQ ID:25732, to the nucleotide sequence of VGAM1100 RNA, herein designated VGAM RNA, also designated SEQ ID:3811.

[39914] Another function of VGAM1100 is therefore inhibition of FKSG42 (Accession NM_032032). Accordingly, utilities of VGAM1100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FKSG42. KIAA0940 (Accession NM_014912) is another VGAM1100 host target gene. KIAA0940 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0940, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0940 BINDING SITE, designated SEQ ID:17147, to the nucleotide sequence of VGAM1100 RNA, herein designated VGAM RNA, also designated SEQ ID:3811.

[39915] Another function of VGAM1100 is therefore inhibition of KIAA0940 (Accession NM_014912). Accordingly, utilities

of VGAM1100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0940. Polymerase (DNA directed), Mu (POLM, Accession XM_165867) is another VGAM1100 host target gene. POLM BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by POLM, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of POLM BINDING SITE, designated SEQ ID:43784, to the nucleotide sequence of VGAM1100 RNA, herein designated VGAM RNA, also designated SEQ ID:3811.

[39916] Another function of VGAM1100 is therefore inhibition of Polymerase (DNA directed), Mu (POLM, Accession XM_165867). Accordingly, utilities of VGAM1100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with POLM. Rac GTPase Activating Protein 1 (RACGAP1, Accession NM_013277) is another VGAM1100 host target gene. RACGAP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RACGAP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of RACGAP1 BINDING SITE, designated SEQ ID:14942, to the nucleotide sequence of VGAM1100 RNA, herein designated VGAM RNA, also designated SEQ ID:3811.

[39917] Another function of VGAM1100 is therefore inhibition of Rac GTPase Activating Protein 1 (RACGAP1, Accession NM_013277). Accordingly, utilities of VGAM1100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RACGAP1. LOC201626 (Accession XM_114349) is another VGAM1100 host target gene. LOC201626 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC201626, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201626 BINDING SITE, designated SEQ ID:42887, to the nucleotide sequence of VGAM1100 RNA, herein designated VGAM RNA, also designated SEQ ID:3811.

[39918] Another function of VGAM1100 is therefore inhibition of LOC201626 (Accession XM_114349). Accordingly, utilities of VGAM1100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC201626. LOC91522 (Accession XM_038953) is another VGAM1100 host target gene. LOC91522 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91522, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91522 BINDING SITE, designated SEQ ID:32962, to the nucleotide sequence of VGAM1100 RNA, herein designated VGAM RNA, also designated SEQ ID:3811.

[39919] Another function of VGAM1100 is therefore inhibition of LOC91522 (Accession XM_038953). Accordingly, utilities of VGAM1100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91522. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1101 (VGAM1101) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[39920] VGAM1101 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM1101 was detected is described hereinabove with reference to Figs. 1–8.

[39921] VGAM1101 gene, herein designated VGAM GENE, is a viral gene contained in the genome of African Swine Fever Virus. VGAM1101 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[39922] VGAM1101 gene encodes a VGAM1101 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1101 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1101 precursor RNA is designated SEQ ID:1087, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1087 is located at position 126143 relative to the genome of African Swine Fever Virus.

[39923] VGAM1101 precursor RNA folds onto itself, forming VGAM1101 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide

sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[39924] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1101 folded precursor RNA into VGAM1101 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 51%) nucleotide sequence of VGAM1101 RNA is designated SEQ ID:3812, and is provided hereinbelow with reference to the sequence listing part.

[39925] VGAM1101 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1101 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1101 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[39926] VGAM1101 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM1101 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1101 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1101 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1101 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[39927] The complementary binding of VGAM1101 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM1101 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1101 host target RNA into VGAM1101 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[39928] It is appreciated that VGAM1101 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1101 host target genes. The mRNA of each one of this plurality of VGAM1101 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1101 RNA, herein designated VGAM RNA, and which when bound by VGAM1101 RNA causes inhibition of translation of respective one or more VGAM1101 host target proteins.

[39929] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1101 gene, herein designated VGAM GENE, on one or more VGAM1101 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[39930] It is yet further appreciated that a function of VGAM1101 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1101 include diagnosis, prevention and treatment of viral infection by African Swine Fever Virus. Specific functions, and accordingly utilities, of VGAM1101 correlate with, and may be deduced from, the identity of the host target genes which VGAM1101 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[39931] Nucleotide sequences of the VGAM1101 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1101 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM1101 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1101 are further described hereinbelow with reference to Table 1.

[39932] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1101 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1101 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[39933] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1101 gene, herein designated VGAM is inhibition of expression of VGAM1101 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1101 correlate with, and may be deduced from, the identity of the target genes which VGAM1101 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[39934] HRAS-like Suppressor (HRASLS, Accession NM_020386) is a VGAM1101 host target gene. HRASLS BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by HRASLS, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HRASLS BINDING SITE, designated SEQ ID:21658, to the nucleotide sequence of VGAM1101 RNA, herein designated VGAM RNA, also designated SEQ ID:3812.

[39935] A function of VGAM1101 is therefore inhibition of HRAS-like Suppressor (HRASLS, Accession NM_020386), a gene which may regulate the Ha-ras-mediated signaling pathway. Accordingly, utilities of VGAM1101 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HRASLS. The function of HRASLS has been established by previous studies. By differential display between 2 mouse cell lines, Akiyama et al. (1999) cloned a cDNA encoding a novel mouse protein, called A-C1, and showed that it modulates an HRAS (OMIM Ref. No. 190020)-mediated signaling pathway in vitro. Ito et al. (2001) isolated a partial cDNA encoding the human homolog, designated HRASLS, by RT-PCR with mRNA extracted from renal cell carcinoma cells. They used 5-prime and 3-prime RACE to obtain a full-length HRASLS cDNA encoding a 168-amino acid protein that shares 83% sequence identity with the mouse protein. HRASLS contains

2 consensus sequence motifs, DXXG and NKXD, suggesting involvement in a ras-signaling pathway. DXXG is involved in binding to Mg(2+) and gamma-phosphate when GTP is bound, and NKXD is important for binding to the guanine ring. Northern blot analysis detected expression of a 1.1-kb transcript in skeletal muscles, testis, heart, brain, and thyroid. Expression was also detected at low levels in normal bone, but at high levels in osteosarcoma cells.

[39936] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[39937] Akiyama, H.; Hiraki, Y.; Noda, M.; Shigeno, C.; Ito, H.; Nakamura, T. : Molecular cloning and biological activity of a novel Ha-Ras suppressor gene predominantly expressed in skeletal muscle, heart, brain, and bone marrow by differential display using clonal mouse EC cells, ATDC5. J. Biol. Chem. 274: 32192-32197, 1999. ; and

[39938] Ito, H.; Akiyama, H.; Shigeno, C.; Nakamura, T. : Isolation, characterization, and chromosome mapping of a human A-C1 Ha-Ras suppressor gene (HRASLS). Cytogenet. Cell Genet. 93: 36-39.

[39939] Further studies establishing the function and utilities of

HRASLS are found in John Hopkins OMIM database record ID 606487, and in cited publications numbered 5552–5553 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Solute Carrier Family 7 (cationic amino acid transporter, γ^+ system), Member 5 (SLC7A5, Accession NM_003486) is another VGAM1101 host target gene. SLC7A5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC7A5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC7A5 BINDING SITE, designated SEQ ID:9576, to the nucleotide sequence of VGAM1101 RNA, herein designated VGAM RNA, also designated SEQ ID:3812.

[39940] Another function of VGAM1101 is therefore inhibition of Solute Carrier Family 7 (cationic amino acid transporter, γ^+ system), Member 5 (SLC7A5, Accession NM_003486), a gene which mediates transport of large and small neutral amino acids. Accordingly, utilities of VGAM1101 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC7A5. The function of SLC7A5 and its association with various diseases and clin-

ical conditions, has been established by previous studies, as described hereinabove with reference to VGAM430. Wolf-Hirschhorn Syndrome Candidate 1 (WHSC1, Accession NM_133333) is another VGAM1101 host target gene. WHSC1 BINDING SITE1 through WHSC1 BINDING SITE4 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by WHSC1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WHSC1 BINDING SITE1 through WHSC1 BINDING SITE4, designated SEQ ID:28465, SEQ ID:28476, SEQ ID:17184 and SEQ ID:28448 respectively, to the nucleotide sequence of VGAM1101 RNA, herein designated VGAM RNA, also designated SEQ ID:3812.

[39941] Another function of VGAM1101 is therefore inhibition of Wolf-Hirschhorn Syndrome Candidate 1 (WHSC1, Accession NM_133333), a gene which binds covalently to and repairs g/t mismatches. Accordingly, utilities of VGAM1101 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WHSC1. The function of WHSC1 and its association with various diseases and clinical conditions, has been established by

previous studies, as described hereinabove with reference to VGAM200. Chloride Intracellular Channel 5 (CLIC5, Accession NM_016929) is another VGAM1101 host target gene. CLIC5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CLIC5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLIC5 BINDING SITE, designated SEQ ID:18845, to the nucleotide sequence of VGAM1101 RNA, herein designated VGAM RNA, also designated SEQ ID:3812.

[39942] Another function of VGAM1101 is therefore inhibition of Chloride Intracellular Channel 5 (CLIC5, Accession NM_016929). Accordingly, utilities of VGAM1101 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLIC5. I(3)mbt-like (Drosophila) (L3MBTL, Accession XM_045421) is another VGAM1101 host target gene. L3MBTL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by L3MBTL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of L3MBTL

BINDING SITE, designated SEQ ID:34457, to the nucleotide sequence of VGAM1101 RNA, herein designated VGAM RNA, also designated SEQ ID:3812.

[39943] Another function of VGAM1101 is therefore inhibition of I(3)mbt-like (Drosophila) (L3MBTL, Accession XM_045421). Accordingly, utilities of VGAM1101 include diagnosis, prevention and treatment of diseases and clinical conditions associated with L3MBTL. LOC149576 (Accession XM_086580) is another VGAM1101 host target gene. LOC149576 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC149576, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149576 BINDING SITE, designated SEQ ID:38776, to the nucleotide sequence of VGAM1101 RNA, herein designated VGAM RNA, also designated SEQ ID:3812.

[39944] Another function of VGAM1101 is therefore inhibition of LOC149576 (Accession XM_086580). Accordingly, utilities of VGAM1101 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149576. LOC149668 (Accession XM_097692) is an-

other VGAM1101 host target gene. LOC149668 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC149668, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149668 BINDING SITE, designated SEQ ID:41029, to the nucleotide sequence of VGAM1101 RNA, herein designated VGAM RNA, also designated SEQ ID:3812.

[39945] Another function of VGAM1101 is therefore inhibition of LOC149668 (Accession XM_097692). Accordingly, utilities of VGAM1101 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149668. LOC221489 (Accession XM_168066) is another VGAM1101 host target gene. LOC221489 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC221489, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221489 BINDING SITE, designated SEQ ID:44983, to the nucleotide sequence of VGAM1101 RNA, herein designated VGAM RNA, also designated SEQ ID:3812.

[39946] Another function of VGAM1101 is therefore inhibition of LOC221489 (Accession XM_168066). Accordingly, utilities of VGAM1101 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221489. LOC84570 (Accession NM_032518) is another VGAM1101 host target gene. LOC84570 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC84570, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC84570 BINDING SITE, designated SEQ ID:26266, to the nucleotide sequence of VGAM1101 RNA, herein designated VGAM RNA, also designated SEQ ID:3812.

[39947] Another function of VGAM1101 is therefore inhibition of LOC84570 (Accession NM_032518). Accordingly, utilities of VGAM1101 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC84570. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1102 (VGAM1102) viral gene, which modulates expression of respective host target genes

thereof, the function and utility of which host target genes is known in the art.

[39948] VGAM1102 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1102 was detected is described hereinabove with reference to Figs. 1–8.

[39949] VGAM1102 gene, herein designated VGAM GENE, is a viral gene contained in the genome of African Swine Fever Virus. VGAM1102 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[39950] VGAM1102 gene encodes a VGAM1102 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1102 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1102 precursor RNA is designated SEQ ID:1088, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1088 is located at position 123478 relative to the genome of African Swine Fever Virus.

[39951] VGAM1102 precursor RNA folds onto itself, forming VGAM1102 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[39952] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1102 folded precursor RNA into VGAM1102 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of VGAM1102 RNA is designated SEQ ID:3813, and is provided hereinbelow with reference to the sequence listing part.

[39953] VGAM1102 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1102 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1102 host target RNA comprises three regions, as is typical of mRNA of a pro-

tein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[39954] VGAM1102 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1102 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1102 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1102 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1102 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[39955] The complementary binding of VGAM1102 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1102 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1102 host target RNA into VGAM1102 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[39956] It is appreciated that VGAM1102 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1102 host target genes. The mRNA of each one of this plurality of VGAM1102 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1102 RNA, herein designated VGAM RNA, and which when bound by VGAM1102 RNA causes inhibition of translation of respective one or more VGAM1102 host target proteins.

[39957] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM1102 gene, herein designated VGAM GENE, on one or more VGAM1102 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[39958] It is yet further appreciated that a function of VGAM1102 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1102 include diagnosis, prevention and treatment of viral infection by African Swine Fever Virus. Specific functions, and accordingly utilities, of VGAM1102 correlate with, and may be deduced from, the identity of the host target genes which VGAM1102 binds and inhibits, and the function of these host target genes, as

elaborated hereinbelow.

[39959] Nucleotide sequences of the VGAM1102 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1102 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1102 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1102 are further described hereinbelow with reference to Table 1.

[39960] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1102 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1102 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[39961] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1102 gene, herein designated VGAM is inhibition of expression of VGAM1102 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1102 correlate with, and may be deduced from, the identity of the target genes which VGAM1102 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[39962] Polypyrimidine Tract Binding Protein 2 (PTBP2, Accession NM_021190) is a VGAM1102 host target gene. PTBP2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PTBP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTBP2 BINDING SITE, designated SEQ ID:22168, to the nucleotide sequence of VGAM1102 RNA, herein designated VGAM RNA, also designated SEQ ID:3813.

[39963] A function of VGAM1102 is therefore inhibition of Polypyrimidine Tract Binding Protein 2 (PTBP2, Accession NM_021190). Accordingly, utilities of VGAM1102 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTBP2. Zinc Finger Protein 36, C3H Type-like 2 (ZFP36L2, Accession NM_006887) is another VGAM1102 host target gene. ZFP36L2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZFP36L2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZFP36L2 BINDING SITE, designated SEQ ID:13753, to the

nucleotide sequence of VGAM1102 RNA, herein designated VGAM RNA, also designated SEQ ID:3813.

[39964] Another function of VGAM1102 is therefore inhibition of Zinc Finger Protein 36, C3H Type-like 2 (ZFP36L2, Accession NM_006887). Accordingly, utilities of VGAM1102 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZFP36L2. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1103 (VGAM1103) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[39965] VGAM1103 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1103 was detected is described hereinabove with reference to Figs. 1–8.

[39966] VGAM1103 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Strawberry Mottle Virus. VGAM1103 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[39967] VGAM1103 gene encodes a VGAM1103 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1103 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1103 precursor RNA is designated SEQ ID:1089, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1089 is located at position 1299 relative to the genome of Strawberry Mottle Virus.

[39968] VGAM1103 precursor RNA folds onto itself, forming VGAM1103 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[39969] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1103 folded precursor RNA into VGAM1103 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of VGAM1103 RNA is designated SEQ ID:3814, and is provided hereinbelow with reference to the sequence listing part.

[39970] VGAM1103 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1103 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1103 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[39971] VGAM1103 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1103 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1103 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1103 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1103 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[39972] The complementary binding of VGAM1103 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1103 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1103 host target RNA into VGAM1103 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[39973] It is appreciated that VGAM1103 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM1103 host target genes. The mRNA of each one of this plurality of VGAM1103 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1103 RNA, herein designated VGAM RNA, and which when bound by VGAM1103 RNA causes inhibition of translation of respective one or more VGAM1103 host target proteins.

[39974] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1103 gene, herein designated VGAM GENE, on one or more VGAM1103 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science
294,779 (2001)).

[39975] It is yet further appreciated that a function of VGAM1103 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1103 include diagnosis, prevention and treatment of viral infection by Strawberry Mottle Virus. Specific functions, and accordingly utilities, of VGAM1103 correlate with, and may be deduced from, the identity of the host target genes which VGAM1103 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[39976] Nucleotide sequences of the VGAM1103 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1103 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1103 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1103 are further described hereinbelow with reference to Table 1.

[39977] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1103 host target RNA, and schematic representation of the complementarity of each

of these host target binding sites to VGAM1103 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[39978] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1103 gene, herein designated VGAM is inhibition of expression of VGAM1103 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1103 correlate with, and may be deduced from, the identity of the target genes which VGAM1103 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[39979] Glial Fibrillary Acidic Protein (GFAP, Accession NM_002055) is a VGAM1103 host target gene. GFAP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GFAP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GFAP BINDING SITE, designated SEQ ID:7813, to the nucleotide sequence of VGAM1103 RNA, herein designated VGAM RNA, also designated SEQ ID:3814.

[39980] A function of VGAM1103 is therefore inhibition of Glial Fibrillary Acidic Protein (GFAP, Accession NM_002055).

Accordingly, utilities of VGAM1103 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GFAP. Huntingtin Interacting Protein 2 (HIP2, Accession NM_005339) is another VGAM1103 host target gene. HIP2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HIP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HIP2 BINDING SITE, designated SEQ ID:11814, to the nucleotide sequence of VGAM1103 RNA, herein designated VGAM RNA, also designated SEQ ID:3814.

[39981] Another function of VGAM1103 is therefore inhibition of Huntingtin Interacting Protein 2 (HIP2, Accession NM_005339). Accordingly, utilities of VGAM1103 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HIP2. Interleukin 15 Receptor, Alpha (IL15RA, Accession NM_002189) is another VGAM1103 host target gene. IL15RA BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by IL15RA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL15RA BINDING SITE, designated SEQ ID:7946, to the nucleotide sequence of VGAM1103 RNA, herein designated VGAM RNA, also designated SEQ ID:3814.

[39982] Another function of VGAM1103 is therefore inhibition of Interleukin 15 Receptor, Alpha (IL15RA, Accession NM_002189), a gene which is essential for signal transduction. Accordingly, utilities of VGAM1103 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL15RA. The function of IL15RA has been established by previous studies. Interleukin 2 (OMIM Ref. No. 147680) and interleukin 15 (OMIM Ref. No. 600554) are cytokines with overlapping but distinct biologic effects. Their receptors share 2 subunits, the IL2R beta (OMIM Ref. No. 146710) and gamma (OMIM Ref. No. 308380) chains, which are essential for signal transduction. The IL2 receptor requires an additional IL2-specific alpha subunit for high affinity IL2 binding (OMIM Ref. No. 147730). Giri et al. (1995) identified and cloned a murine IL15-specific alpha subunit and showed that it is structurally related to IL2R-alpha. However, the murine IL15R-alpha alone bound IL15 with a 1,000-fold higher

affinity than that seen with IL2R-alpha and IL2. Anderson et al. (1995) extended these studies into the human system with the isolation of 3 differentially spliced human IL15R-alpha variants that are all capable of high affinity binding of IL15. The cytoplasmic domain of IL15R-alpha, like that of IL2R-alpha is dispensable for mitogenic signaling, suggesting that the primary role of the alpha chains is to confer high affinity binding. At high concentrations, IL-15, like IL-2, is able to signal through a complex of IL2R-beta and -gamma in the absence of the alpha subunit. Furthermore, the IL15RA and IL2RA genes have a similar intron/exon organization and are closely linked in both human and murine genomes. The IL2RA gene (OMIM Ref. No. 147730) had been previously mapped to 10p15-p14 and its homolog to mouse chromosome 2. The human gene IL15RA was mapped to 10p15-p14 by fluorescence in situ hybridization and the mouse Il15ra gene was mapped to chromosome 2 by interspecific backcross mapping.

[39983] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[39984] Anderson, D. M.; Kumaki, S.; Ahdieh, M.; Bertles, J.;

Tometsko, M.; Loomis, A.; Giri, J.; Copeland, N. G.; Gilbert, D. J.; Jenkins, N. A.; Valentine, V.; Shapiro, D. N.; Morris, S. W.; Park, L. S.; Cosman, D. : Functional characterization of the human interleukin-15 receptor alpha chain and close linkage of IL15RA and IL2RA genes. J. Biol. Chem. 270: 29862-29869, 1995. ; and

[39985] Giri, J. G.; Kumaki, S.; Ahdieh, M.; Friend, D. J.; Loomis, A.; Shanebeck, K.; DuBose, R.; Cosman, D.; Park, L. S.; Anderson, D. M. : Identification and cloning of a novel IL-15 binding.

[39986] Further studies establishing the function and utilities of IL15RA are found in John Hopkins OMIM database record ID 601070, and in cited publications numbered 7860-7861 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. LIM Domain Kinase 1 (LIMK1, Accession NM_016735) is another VGAM1103 host target gene. LIMK1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LIMK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LIMK1 BINDING SITE, designated SEQ ID:18795, to the nucleotide sequence of

VGAM1103 RNA, herein designated VGAM RNA, also designated SEQ ID:3814.

[39987] Another function of VGAM1103 is therefore inhibition of LIM Domain Kinase 1 (LIMK1, Accession NM_016735). Accordingly, utilities of VGAM1103 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LIMK1. Podocalyxin-like (PODXL, Accession NM_005397) is another VGAM1103 host target gene. PODXL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PODXL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PODXL BINDING SITE, designated SEQ ID:11871, to the nucleotide sequence of VGAM1103 RNA, herein designated VGAM RNA, also designated SEQ ID:3814.

[39988] Another function of VGAM1103 is therefore inhibition of Podocalyxin-like (PODXL, Accession NM_005397), a gene which is an antiadhesin. Accordingly, utilities of VGAM1103 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PODXL. The function of PODXL and its association with various

diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM247.COE2 (Accession XM_034639) is another VGAM1103 host target gene. COE2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by COE2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COE2 BINDING SITE, designated SEQ ID:32126, to the nucleotide sequence of VGAM1103 RNA, herein designated VGAM RNA, also designated SEQ ID:3814.

[39989] Another function of VGAM1103 is therefore inhibition of COE2 (Accession XM_034639). Accordingly, utilities of VGAM1103 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COE2. DKFZp547H236 (Accession XM_085929) is another VGAM1103 host target gene. DKFZp547H236 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DKFZp547H236, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-

quences of DKFZp547H236 BINDING SITE, designated SEQ ID:38405, to the nucleotide sequence of VGAM1103 RNA, herein designated VGAM RNA, also designated SEQ ID:3814.

[39990] Another function of VGAM1103 is therefore inhibition of DKFZp547H236 (Accession XM_085929). Accordingly, utilities of VGAM1103 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp547H236. Epididymal Sperm Binding Protein 1 (ELSPBP1, Accession NM_022142) is another VGAM1103 host target gene. ELSPBP1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ELSPBP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ELSPBP1 BINDING SITE, designated SEQ ID:22704, to the nucleotide sequence of VGAM1103 RNA, herein designated VGAM RNA, also designated SEQ ID:3814.

[39991] Another function of VGAM1103 is therefore inhibition of Epididymal Sperm Binding Protein 1 (ELSPBP1, Accession NM_022142). Accordingly, utilities of VGAM1103 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with ELSPBP1. Ecotropic Viral Integration Site 5 (EVI5, Accession NM_005665) is another VGAM1103 host target gene. EVI5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by EVI5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EVI5 BINDING SITE, designated SEQ ID:12210, to the nucleotide sequence of VGAM1103 RNA, herein designated VGAM RNA, also designated SEQ ID:3814.

[39992] Another function of VGAM1103 is therefore inhibition of Ecotropic Viral Integration Site 5 (EVI5, Accession NM_005665). Accordingly, utilities of VGAM1103 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EVI5. FLJ10853 (Accession NM_018246) is another VGAM1103 host target gene. FLJ10853 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10853, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10853 BINDING SITE, designated SEQ

ID:20214, to the nucleotide sequence of VGAM1103 RNA, herein designated VGAM RNA, also designated SEQ ID:3814.

[39993] Another function of VGAM1103 is therefore inhibition of FLJ10853 (Accession NM_018246). Accordingly, utilities of VGAM1103 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10853. FLJ12770 (Accession NM_032174) is another VGAM1103 host target gene. FLJ12770 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12770, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12770 BINDING SITE, designated SEQ ID:25885, to the nucleotide sequence of VGAM1103 RNA, herein designated VGAM RNA, also designated SEQ ID:3814.

[39994] Another function of VGAM1103 is therefore inhibition of FLJ12770 (Accession NM_032174). Accordingly, utilities of VGAM1103 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12770. FLJ13491 (Accession NM_024623) is another VGAM1103 host target gene. FLJ13491 BINDING SITE is

HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ13491, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13491 BINDING SITE, designated SEQ ID:23887, to the nucleotide sequence of VGAM1103 RNA, herein designated VGAM RNA, also designated SEQ ID:3814.

[39995] Another function of VGAM1103 is therefore inhibition of FLJ13491 (Accession NM_024623). Accordingly, utilities of VGAM1103 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13491. FLJ14166 (Accession NM_024565) is another VGAM1103 host target gene. FLJ14166 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ14166, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14166 BINDING SITE, designated SEQ ID:23791, to the nucleotide sequence of VGAM1103 RNA, herein designated VGAM RNA, also designated SEQ ID:3814.

[39996] Another function of VGAM1103 is therefore inhibition of

FLJ14166 (Accession NM_024565). Accordingly, utilities of VGAM1103 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14166. FLJ14564 (Accession XM_084459) is another VGAM1103 host target gene. FLJ14564 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14564, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14564 BINDING SITE, designated SEQ ID:37595, to the nucleotide sequence of VGAM1103 RNA, herein designated VGAM RNA, also designated SEQ ID:3814.

[39997] Another function of VGAM1103 is therefore inhibition of FLJ14564 (Accession XM_084459). Accordingly, utilities of VGAM1103 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14564. FLJ20315 (Accession NM_017763) is another VGAM1103 host target gene. FLJ20315 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20315, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of FLJ20315 BINDING SITE, designated SEQ ID:19378, to the nucleotide sequence of VGAM1103 RNA, herein designated VGAM RNA, also designated SEQ ID:3814.

[39998] Another function of VGAM1103 is therefore inhibition of FLJ20315 (Accession NM_017763). Accordingly, utilities of VGAM1103 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20315. HTCD37 (Accession XM_041884) is another VGAM1103 host target gene. HTCD37 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HTCD37, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HTCD37 BINDING SITE, designated SEQ ID:33617, to the nucleotide sequence of VGAM1103 RNA, herein designated VGAM RNA, also designated SEQ ID:3814.

[39999] Another function of VGAM1103 is therefore inhibition of HTCD37 (Accession XM_041884). Accordingly, utilities of VGAM1103 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HTCD37. KIAA0040 (Accession NM_014656) is another

VGAM1103 host target gene. KIAA0040 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0040, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0040 BINDING SITE, designated SEQ ID:16096, to the nucleotide sequence of VGAM1103 RNA, herein designated VGAM RNA, also designated SEQ ID:3814.

[40000] Another function of VGAM1103 is therefore inhibition of KIAA0040 (Accession NM_014656). Accordingly, utilities of VGAM1103 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0040. KIAA0682 (Accession NM_016196) is another VGAM1103 host target gene. KIAA0682 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0682, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0682 BINDING SITE, designated SEQ ID:18289, to the nucleotide sequence of VGAM1103 RNA, herein designated VGAM RNA, also designated SEQ ID:3814.

[40001] Another function of VGAM1103 is therefore inhibition of KIAA0682 (Accession NM_016196). Accordingly, utilities of VGAM1103 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0682. KIAA1297 (Accession XM_051005) is another VGAM1103 host target gene. KIAA1297 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1297, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1297 BINDING SITE, designated SEQ ID:35712, to the nucleotide sequence of VGAM1103 RNA, herein designated VGAM RNA, also designated SEQ ID:3814.

[40002] Another function of VGAM1103 is therefore inhibition of KIAA1297 (Accession XM_051005). Accordingly, utilities of VGAM1103 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1297. KIAA1854 (Accession XM_049884) is another VGAM1103 host target gene. KIAA1854 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1854, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1854 BINDING SITE, designated SEQ ID:35525, to the nucleotide sequence of VGAM1103 RNA, herein designated VGAM RNA, also designated SEQ ID:3814.

[40003] Another function of VGAM1103 is therefore inhibition of KIAA1854 (Accession XM_049884). Accordingly, utilities of VGAM1103 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1854. My015 (Accession XM_039512) is another VGAM1103 host target gene. My015 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by My015, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of My015 BINDING SITE, designated SEQ ID:33105, to the nucleotide sequence of VGAM1103 RNA, herein designated VGAM RNA, also designated SEQ ID:3814.

[40004] Another function of VGAM1103 is therefore inhibition of My015 (Accession XM_039512). Accordingly, utilities of VGAM1103 include diagnosis, prevention and treatment of diseases and clinical conditions associated with My015.

LOC122553 (Accession XM_058630) is another VGAM1103 host target gene. LOC122553 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC122553, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC122553 BINDING SITE, designated SEQ ID:36689, to the nucleotide sequence of VGAM1103 RNA, herein designated VGAM RNA, also designated SEQ ID:3814.

[40005] Another function of VGAM1103 is therefore inhibition of LOC122553 (Accession XM_058630). Accordingly, utilities of VGAM1103 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC122553. LOC149146 (Accession XM_086441) is another VGAM1103 host target gene. LOC149146 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC149146, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149146 BINDING SITE, designated SEQ ID:38654, to the nucleotide sequence of VGAM1103 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3814.

[40006] Another function of VGAM1103 is therefore inhibition of LOC149146 (Accession XM_086441). Accordingly, utilities of VGAM1103 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149146. LOC150279 (Accession XM_086820) is another VGAM1103 host target gene. LOC150279 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150279, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150279 BINDING SITE, designated SEQ ID:38899, to the nucleotide sequence of VGAM1103 RNA, herein designated VGAM RNA, also designated SEQ ID:3814.

[40007] Another function of VGAM1103 is therefore inhibition of LOC150279 (Accession XM_086820). Accordingly, utilities of VGAM1103 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150279. LOC150951 (Accession XM_097975) is another VGAM1103 host target gene. LOC150951 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150951, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150951 BINDING SITE, designated SEQ ID:41278, to the nucleotide sequence of VGAM1103 RNA, herein designated VGAM RNA, also designated SEQ ID:3814.

[40008] Another function of VGAM1103 is therefore inhibition of LOC150951 (Accession XM_097975). Accordingly, utilities of VGAM1103 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150951. LOC158549 (Accession XM_098963) is another VGAM1103 host target gene. LOC158549 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC158549, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158549 BINDING SITE, designated SEQ ID:42005, to the nucleotide sequence of VGAM1103 RNA, herein designated VGAM RNA, also designated SEQ ID:3814.

[40009] Another function of VGAM1103 is therefore inhibition of LOC158549 (Accession XM_098963). Accordingly, utilities of VGAM1103 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC158549. LOC255252 (Accession XM_170779) is another VGAM1103 host target gene. LOC255252 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC255252, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255252 BINDING SITE, designated SEQ ID:45545, to the nucleotide sequence of VGAM1103 RNA, herein designated VGAM RNA, also designated SEQ ID:3814.

[40010] Another function of VGAM1103 is therefore inhibition of LOC255252 (Accession XM_170779). Accordingly, utilities of VGAM1103 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255252. LOC255452 (Accession XM_174088) is another VGAM1103 host target gene. LOC255452 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC255452, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255452 BINDING SITE, designated SEQ ID:46573, to

the nucleotide sequence of VGAM1103 RNA, herein designated VGAM RNA, also designated SEQ ID:3814.

[40011] Another function of VGAM1103 is therefore inhibition of LOC255452 (Accession XM_174088). Accordingly, utilities of VGAM1103 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255452. LOC257428 (Accession XM_168584) is another VGAM1103 host target gene. LOC257428 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC257428, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257428 BINDING SITE, designated SEQ ID:45260, to the nucleotide sequence of VGAM1103 RNA, herein designated VGAM RNA, also designated SEQ ID:3814.

[40012] Another function of VGAM1103 is therefore inhibition of LOC257428 (Accession XM_168584). Accordingly, utilities of VGAM1103 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257428. LOC55831 (Accession NM_018447) is another VGAM1103 host target gene. LOC55831 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by LOC55831, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC55831 BINDING SITE, designated SEQ ID:20516, to the nucleotide sequence of VGAM1103 RNA, herein designated VGAM RNA, also designated SEQ ID:3814.

[40013] Another function of VGAM1103 is therefore inhibition of LOC55831 (Accession NM_018447). Accordingly, utilities of VGAM1103 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC55831. LOC91050 (Accession XM_035703) is another VGAM1103 host target gene. LOC91050 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91050, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91050 BINDING SITE, designated SEQ ID:32334, to the nucleotide sequence of VGAM1103 RNA, herein designated VGAM RNA, also designated SEQ ID:3814.

[40014] Another function of VGAM1103 is therefore inhibition of LOC91050 (Accession XM_035703). Accordingly, utilities

of VGAM1103 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91050. LOC91149 (Accession XM_036480) is another VGAM1103 host target gene. LOC91149 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC91149, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91149 BINDING SITE, designated SEQ ID:32456, to the nucleotide sequence of VGAM1103 RNA, herein designated VGAM RNA, also designated SEQ ID:3814.

[40015] Another function of VGAM1103 is therefore inhibition of LOC91149 (Accession XM_036480). Accordingly, utilities of VGAM1103 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91149. LOC91748 (Accession XM_040343) is another VGAM1103 host target gene. LOC91748 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC91748, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

LOC91748 BINDING SITE, designated SEQ ID:33286, to the nucleotide sequence of VGAM1103 RNA, herein designated VGAM RNA, also designated SEQ ID:3814.

[40016] Another function of VGAM1103 is therefore inhibition of LOC91748 (Accession XM_040343). Accordingly, utilities of VGAM1103 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91748. LOC91759 (Accession XM_040467) is another VGAM1103 host target gene. LOC91759 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91759, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91759 BINDING SITE, designated SEQ ID:33303, to the nucleotide sequence of VGAM1103 RNA, herein designated VGAM RNA, also designated SEQ ID:3814.

[40017] Another function of VGAM1103 is therefore inhibition of LOC91759 (Accession XM_040467). Accordingly, utilities of VGAM1103 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91759. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 1104 (VGAM1104) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[40018] VGAM1104 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1104 was detected is described hereinabove with reference to Figs. 1–8.

[40019] VGAM1104 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Herpesvirus 2. VGAM1104 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[40020] VGAM1104 gene encodes a VGAM1104 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1104 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1104 precursor RNA is designated SEQ ID:1090, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1090 is located at position 94244 relative to the

genome of Human Herpesvirus 2.

[40021] VGAM1104 precursor RNA folds onto itself, forming VGAM1104 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[40022] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1104 folded precursor RNA into VGAM1104 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM1104 RNA is designated SEQ ID:3815, and is provided hereinbelow with reference to the sequence listing part.

[40023] VGAM1104 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM1104 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1104 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[40024] VGAM1104 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1104 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1104 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1104 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1104 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[40025] The complementary binding of VGAM1104 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1104 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1104 host target RNA into VGAM1104 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[40026] It is appreciated that VGAM1104 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1104 host target genes. The mRNA of each one of this plurality of VGAM1104 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1104 RNA, herein designated VGAM RNA, and which when bound by VGAM1104 RNA causes inhibition of translation of respective one or more VGAM1104 host target proteins.

[40027] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1104 gene, herein designated VGAM GENE, on one or more VGAM1104 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[40028] It is yet further appreciated that a function of VGAM1104 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1104 include diagnosis, prevention and treatment of viral infection by Human Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM1104

correlate with, and may be deduced from, the identity of the host target genes which VGAM1104 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[40029] Nucleotide sequences of the VGAM1104 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1104 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1104 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1104 are further described hereinbelow with reference to Table 1.

[40030] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1104 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1104 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[40031] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1104 gene, herein designated VGAM is inhibition of expression of VGAM1104 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1104 correlate with, and may be deduced

from, the identity of the target genes which VGAM1104 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[40032] MGC15854 (Accession NM_145029) is a VGAM1104 host target gene. MGC15854 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC15854, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC15854 BINDING SITE, designated SEQ ID:29642, to the nucleotide sequence of VGAM1104 RNA, herein designated VGAM RNA, also designated SEQ ID:3815.

[40033] A function of VGAM1104 is therefore inhibition of MGC15854 (Accession NM_145029). Accordingly, utilities of VGAM1104 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC15854. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1105 (VGAM1105) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes

is known in the art.

[40034] VGAM1105 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1105 was detected is described hereinabove with reference to Figs. 1–8.

[40035] VGAM1105 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Herpesvirus 2. VGAM1105 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[40036] VGAM1105 gene encodes a VGAM1105 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1105 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1105 precursor RNA is designated SEQ ID:1091, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1091 is located at position 97913 relative to the genome of Human Herpesvirus 2.

[40037] VGAM1105 precursor RNA folds onto itself, forming VGAM1105 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two–

dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[40038] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1105 folded precursor RNA into VGAM1105 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1105 RNA is designated SEQ ID:3816, and is provided hereinbelow with reference to the sequence listing part.

[40039] VGAM1105 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1105 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1105 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein cod-

ing region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[40040] VGAM1105 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1105 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1105 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1105 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1105 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR

and 5`UTR regions.

[40041] The complementary binding of VGAM1105 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1105 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1105 host target RNA into VGAM1105 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[40042] It is appreciated that VGAM1105 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1105 host target genes. The mRNA of each one of this plurality of VGAM1105 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1105 RNA, herein designated VGAM RNA, and which when bound by VGAM1105 RNA causes inhibition of translation of respective one or more VGAM1105 host target proteins.

[40043] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1105 gene, herein designated VGAM GENE, on one

or more VGAM1105 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[40044] It is yet further appreciated that a function of VGAM1105 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1105 include diagnosis, prevention and treatment of viral infection by Human Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM1105 correlate with, and may be deduced from, the identity of the host target genes which VGAM1105 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[40045] Nucleotide sequences of the VGAM1105 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1105 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1105 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1105 are further described hereinbelow with reference to Table 1.

[40046] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1105 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1105 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[40047] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1105 gene, herein designated VGAM is inhibition of expression of VGAM1105 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1105 correlate with, and may be deduced from, the identity of the target genes which VGAM1105 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[40048] Coatomer Protein Complex, Subunit Alpha (COPA, Acces-

sion NM_004371) is a VGAM1105 host target gene. COPA BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by COPA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COPA BINDING SITE, designated SEQ ID:10591, to the nucleotide sequence of VGAM1105 RNA, herein designated VGAM RNA, also designated SEQ ID:3816.

[40049] A function of VGAM1105 is therefore inhibition of Coatomer Protein Complex, Subunit Alpha (COPA, Accession NM_004371), a gene which is involved protein transport between the endoplasmic reticulum (ER) and Golgi compartments. Accordingly, utilities of VGAM1105 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COPA. The function of COPA has been established by previous studies. In eukaryotic cells, protein transport between the endoplasmic reticulum (ER) and Golgi compartments is mediated in part by non-clathrin-coated vesicular coat proteins (COPs). Seven COP subunits have been recognized, and represent components of a complex known as coatomer, or COPI. The subunits are designated alpha-COP, beta-COP (OMIM

Ref. No. 600959), beta-prime-COP, gamma-COP, delta-COP (OMIM Ref. No. 600820), epsilon-COP (OMIM Ref. No. 606942), and zeta-COP COPI is a heptameric protein recruited to membranes by ARF1 (OMIM Ref. No. 103180), a GTP-binding protein. Coat assembly helps in the transport of budding off membrane between the ER and Golgi apparatus. Using fluorescence microscopy, Presley et al. (2002) showed that guanine nucleotide exchange-activated ARF1 at the Golgi membrane recruits and binds cytoplasmic COPI to the membranes. Photobleaching experiments demonstrated that COPI remains at the membranes after ARF1 has been hydrolysed by GTPase-activating protein (GAP; 139150). COPI binds to membrane cargo, soluble-cargo receptors, or other Golgi proteins. Uncoating, or the release of COPI from Golgi membranes to the cytoplasm, then occurs, which is inhibited by AIF (PDIC8; 300169). Presley et al. (2002) concluded from their kinetic and biochemical analyses that COPI and ARF1 continuously bind and release from Golgi membranes, allowing the membrane at these sites to recruit cargo, alter their phospholipid composition, and become larger, phase-separated domains Chow (1997) reported the genomic organization of the COPA gene. It contains 33 exons ranging in size

from 67 to 611 bp. All exon–intron junctions conform with the GT–AG rule. The 32 introns range from about 80 bp to 4 kb, with the genomic DNA of COPA estimated to span approximately 37 kb. The untranscribed and non-coding portions of the 5–prime end of the gene lacked TATA and CAAT boxes but displayed a high GC content, consistent with its being a housekeeping gene

[40050] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[40051] Presley, J. F.; Ward, T. H.; Pfeifer, A. C.; Siggia, E. D.; Phair, R. D.; Lippincott–Schwartz, J. : Dissection of COPI and Arf1 dynamics in vivo and role in Golgi membrane transport. *Nature* 417: 187–193, 2002. ; and

[40052] Quek, H. H.; Chow, V. T. K. : Genomic organization and mapping of the human HEP–COP gene (COPA) to 1q. *Cytogenet. Cell Genet.* 76: 139–143, 1997.

[40053] Further studies establishing the function and utilities of COPA are found in John Hopkins OMIM database record ID 601924, and in cited publications numbered 581 and 5812–5813 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Forkhead Box D1 (FOXD1, Accession NM_004472) is another

VGAM1105 host target gene. FOXD1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FOXD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FOXD1 BINDING SITE, designated SEQ ID:10779, to the nucleotide sequence of VGAM1105 RNA, herein designated VGAM RNA, also designated SEQ ID:3816.

[40054] Another function of VGAM1105 is therefore inhibition of Forkhead Box D1 (FOXD1, Accession NM_004472), a gene which has regulatory role in embryonic development. Accordingly, utilities of VGAM1105 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FOXD1. The function of FOXD1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM615. Glycogenin (GYG, Accession NM_004130) is another VGAM1105 host target gene. GYG BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GYG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Ta-

ble 2 illustrates the complementarity of the nucleotide sequences of GYG BINDING SITE, designated SEQ ID:10340, to the nucleotide sequence of VGAM1105 RNA, herein designated VGAM RNA, also designated SEQ ID:3816.

[40055] Another function of VGAM1105 is therefore inhibition of Glycogenin (GYG, Accession NM_004130), a gene which primes de novo glycogen synthesis. Accordingly, utilities of VGAM1105 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GYG. The function of GYG and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM777. Protein Tyrosine Phosphatase, Receptor Type, F (PTPRF, Accession NM_002840) is another VGAM1105 host target gene. PTPRF BINDING SITE1 and PTPRF BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PTPRF, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTPRF BINDING SITE1 and PTPRF BINDING SITE2, designated SEQ ID:8724 and SEQ ID:28198 respectively, to the nucleotide sequence of VGAM1105 RNA,

herein designated VGAM RNA, also designated SEQ ID:3816.

[40056] Another function of VGAM1105 is therefore inhibition of Protein Tyrosine Phosphatase, Receptor Type, F (PTPRF, Accession NM_002840), a gene which negatively regulates the insulin signaling pathway. Accordingly, utilities of VGAM1105 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTPRF. The function of PTPRF has been established by previous studies. The LAR gene (symbolized PTPRF) encodes a membrane protein that has a cytoplasmic domain with homology to protein-tyrosine phosphatase 1B (OMIM Ref. No. 176885) and an extracellular domain homologous to the neural cellular adhesion molecule NCAM (OMIM Ref. No. 116930). The human LAR molecule closely resembles cell adhesion molecules, which suggests that it may be involved in the regulation of phosphotyrosine levels through cell-cell or cell-matrix interactions. As a first step toward site-directed mutagenesis studies of LAR function, Schaapveld et al. (1995) characterized the mouse Ptp^rf gene. They found that its cytoplasmic region is encoded by 11 exons that span only 4.5 kb of genomic DNA. Compared to the known exon-intron structures of other mam-

malian receptor-like protein tyrosine phosphatase genes such as Ptp^{ra} (encoding LRP; 176884) and Ptp^{rc} (coding for Ly-5; 151460), the portion of the Ptp^{rf} gene encoding the cytoplasmic region of murine LAR contained not only smaller, but also fewer introns. O'Grady et al. (1994) demonstrated that the human LAR gene is composed of 33 exons spanning over 85 kb. Exon 2 encodes the signal sequence and the first 4 amino acids in the mature LAR protein. The 3 immunoglobulin-like domains are encoded by exons 3 to 7, and the 8 fibronectin type III (OMIM Ref. No. FN-III) domains by exons 8 to 17. Exons 18 to 22 encode the juxtamembrane and transmembrane domains, and exons 23 to 33 encode the 2 conserved tyrosine phosphatase domains and the entire 3-prime untranslated region. Alternative splicing of LAR mRNA was revealed by RT-PCR analysis.

[40057] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[40058] Schaapveld, R. Q. J.; van den Maagdenberg, A. M. J. M.; Schepens, J. T. G.; Olde Weghuis, D.; Geurts van Kessel, A.; Wieringa, B.; Hendriks, W. J. A. J. : The mouse gene Ptp^{rf} encoding the leukocyte common antigen-related

molecule LAR: cloning, characterization, and chromosomal localization. Genomics 27: 124–130, 1995. ; and

[40059] O'Grady, P.; Krueger, N. X.; Streuli, M.; Saito, H. : Genomic organization of the human LAR protein tyrosine phosphatase gene and alternative splicing in the extracellular fibronectin ty.

[40060] Further studies establishing the function and utilities of PTPRF are found in John Hopkins OMIM database record ID 179590, and in cited publications numbered 12382–12390 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Serum/glucocorticoid Regulated Kinase (SGK, Accession NM_005627) is another VGAM1105 host target gene. SGK BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SGK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SGK BINDING SITE, designated SEQ ID:12138, to the nucleotide sequence of VGAM1105 RNA, herein designated VGAM RNA, also designated SEQ ID:3816.

[40061] Another function of VGAM1105 is therefore inhibition of Serum/glucocorticoid Regulated Kinase (SGK, Accession

NM_005627), a gene which Serine/threonine kinase. Accordingly, utilities of VGAM1105 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SGK. The function of SGK and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM543.ATPase, Class II, Type 9A (ATP9A, Accession XM_030577) is another VGAM1105 host target gene. ATP9A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ATP9A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP9A BINDING SITE, designated SEQ ID:31081, to the nucleotide sequence of VGAM1105 RNA, herein designated VGAM RNA, also designated SEQ ID:3816.

[40062] Another function of VGAM1105 is therefore inhibition of ATPase, Class II, Type 9A (ATP9A, Accession XM_030577). Accordingly, utilities of VGAM1105 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP9A. Chromosome 20 Open Reading Frame 59 (C20orf59, Accession NM_022082) is

another VGAM1105 host target gene. C20orf59 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C20orf59, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf59 BINDING SITE, designated SEQ ID:22623, to the nucleotide sequence of VGAM1105 RNA, herein designated VGAM RNA, also designated SEQ ID:3816.

[40063] Another function of VGAM1105 is therefore inhibition of Chromosome 20 Open Reading Frame 59 (C20orf59, Accession NM_022082). Accordingly, utilities of VGAM1105 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf59.

FLJ31300 (Accession NM_144639) is another VGAM1105 host target gene. FLJ31300 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ31300, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ31300 BINDING SITE, designated SEQ ID:29463, to the nucleotide sequence of VGAM1105 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:3816.

[40064] Another function of VGAM1105 is therefore inhibition of FLJ31300 (Accession NM_144639). Accordingly, utilities of VGAM1105 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ31300. Golgi Associated, Gamma Adaptin Ear Containing, ARF Binding Protein 2 (GGA2, Accession NM_138640) is another VGAM1105 host target gene. GGA2 BINDING SITE1 and GGA2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by GGA2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GGA2 BINDING SITE1 and GGA2 BINDING SITE2, designated SEQ ID:28920 and SEQ ID:17399 respectively, to the nucleotide sequence of VGAM1105 RNA, herein designated VGAM RNA, also designated SEQ ID:3816.

[40065] Another function of VGAM1105 is therefore inhibition of Golgi Associated, Gamma Adaptin Ear Containing, ARF Binding Protein 2 (GGA2, Accession NM_138640). Accordingly, utilities of VGAM1105 include diagnosis, prevention and treatment of diseases and clinical conditions associ-

ated with GGA2. KIAA1061 (Accession XM_048786) is another VGAM1105 host target gene. KIAA1061 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1061, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1061 BINDING SITE, designated SEQ ID:35266, to the nucleotide sequence of VGAM1105 RNA, herein designated VGAM RNA, also designated SEQ ID:3816.

[40066] Another function of VGAM1105 is therefore inhibition of KIAA1061 (Accession XM_048786). Accordingly, utilities of VGAM1105 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1061. MGC16386 (Accession NM_080668) is another VGAM1105 host target gene. MGC16386 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC16386, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC16386 BINDING SITE, designated SEQ ID:27960, to the nucleotide sequence of VGAM1105 RNA, herein design-

nated VGAM RNA, also designated SEQ ID:3816.

[40067] Another function of VGAM1105 is therefore inhibition of MGC16386 (Accession NM_080668). Accordingly, utilities of VGAM1105 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC16386. MGC2835 (Accession NM_024072) is another VGAM1105 host target gene. MGC2835 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC2835, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC2835 BINDING SITE, designated SEQ ID:23501, to the nucleotide sequence of VGAM1105 RNA, herein designated VGAM RNA, also designated SEQ ID:3816.

[40068] Another function of VGAM1105 is therefore inhibition of MGC2835 (Accession NM_024072). Accordingly, utilities of VGAM1105 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2835. Paralemmin (PALM, Accession NM_002579) is another VGAM1105 host target gene. PALM BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PALM, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PALM BINDING SITE, designated SEQ ID:8436, to the nucleotide sequence of VGAM1105 RNA, herein designated VGAM RNA, also designated SEQ ID:3816.

[40069] Another function of VGAM1105 is therefore inhibition of Paralemmin (PALM, Accession NM_002579). Accordingly, utilities of VGAM1105 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PALM. VMP1 (Accession NM_030938) is another VGAM1105 host target gene. VMP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by VMP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VMP1 BINDING SITE, designated SEQ ID:25206, to the nucleotide sequence of VGAM1105 RNA, herein designated VGAM RNA, also designated SEQ ID:3816.

[40070] Another function of VGAM1105 is therefore inhibition of VMP1 (Accession NM_030938). Accordingly, utilities of VGAM1105 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with VMP1. LOC147299 (Accession XM_085763) is another VGAM1105 host target gene. LOC147299 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC147299, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147299 BINDING SITE, designated SEQ ID:38333, to the nucleotide sequence of VGAM1105 RNA, herein designated VGAM RNA, also designated SEQ ID:3816.

[40071] Another function of VGAM1105 is therefore inhibition of LOC147299 (Accession XM_085763). Accordingly, utilities of VGAM1105 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147299. LOC147429 (Accession XM_085793) is another VGAM1105 host target gene. LOC147429 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC147429, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147429 BINDING SITE, designated SEQ ID:38339, to

the nucleotide sequence of VGAM1105 RNA, herein designated VGAM RNA, also designated SEQ ID:3816.

[40072] Another function of VGAM1105 is therefore inhibition of LOC147429 (Accession XM_085793). Accordingly, utilities of VGAM1105 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147429. LOC151512 (Accession XM_098072) is another VGAM1105 host target gene. LOC151512 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC151512, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151512 BINDING SITE, designated SEQ ID:41364, to the nucleotide sequence of VGAM1105 RNA, herein designated VGAM RNA, also designated SEQ ID:3816.

[40073] Another function of VGAM1105 is therefore inhibition of LOC151512 (Accession XM_098072). Accordingly, utilities of VGAM1105 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151512. LOC151525 (Accession XM_087231) is another VGAM1105 host target gene. LOC151525 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by LOC151525, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151525 BINDING SITE, designated SEQ ID:39131, to the nucleotide sequence of VGAM1105 RNA, herein designated VGAM RNA, also designated SEQ ID:3816.

[40074] Another function of VGAM1105 is therefore inhibition of LOC151525 (Accession XM_087231). Accordingly, utilities of VGAM1105 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151525. LOC158055 (Accession XM_088453) is another VGAM1105 host target gene. LOC158055 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC158055, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158055 BINDING SITE, designated SEQ ID:39703, to the nucleotide sequence of VGAM1105 RNA, herein designated VGAM RNA, also designated SEQ ID:3816.

[40075] Another function of VGAM1105 is therefore inhibition of LOC158055 (Accession XM_088453). Accordingly, utilities

of VGAM1105 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158055. LOC255104 (Accession XM_170911) is another VGAM1105 host target gene. LOC255104 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC255104, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255104 BINDING SITE, designated SEQ ID:45683, to the nucleotide sequence of VGAM1105 RNA, herein designated VGAM RNA, also designated SEQ ID:3816.

[40076] Another function of VGAM1105 is therefore inhibition of LOC255104 (Accession XM_170911). Accordingly, utilities of VGAM1105 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255104. LOC256364 (Accession XM_170672) is another VGAM1105 host target gene. LOC256364 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC256364, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC256364 BINDING SITE, designated SEQ ID:45445, to the nucleotide sequence of VGAM1105 RNA, herein designated VGAM RNA, also designated SEQ ID:3816.

[40077] Another function of VGAM1105 is therefore inhibition of LOC256364 (Accession XM_170672). Accordingly, utilities of VGAM1105 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256364. LOC51236 (Accession NM_016458) is another VGAM1105 host target gene. LOC51236 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51236, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51236 BINDING SITE, designated SEQ ID:18573, to the nucleotide sequence of VGAM1105 RNA, herein designated VGAM RNA, also designated SEQ ID:3816.

[40078] Another function of VGAM1105 is therefore inhibition of LOC51236 (Accession NM_016458). Accordingly, utilities of VGAM1105 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51236. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 1106 (VGAM1106) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[40079] VGAM1106 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1106 was detected is described hereinabove with reference to Figs. 1–8.

[40080] VGAM1106 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Herpesvirus 2. VGAM1106 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[40081] VGAM1106 gene encodes a VGAM1106 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1106 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1106 precursor RNA is designated SEQ ID:1092, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1092 is located at position 97030 relative to the

genome of Human Herpesvirus 2.

[40082] VGAM1106 precursor RNA folds onto itself, forming VGAM1106 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[40083] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1106 folded precursor RNA into VGAM1106 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1106 RNA is designated SEQ ID:3817, and is provided hereinbelow with reference to the sequence listing part.

[40084] VGAM1106 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM1106 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1106 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[40085] VGAM1106 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1106 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1106 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1106 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1106 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[40086] The complementary binding of VGAM1106 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1106 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1106 host target RNA into VGAM1106 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[40087] It is appreciated that VGAM1106 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1106 host target genes. The mRNA of each one of this plurality of VGAM1106 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1106 RNA, herein designated VGAM RNA, and which when bound by VGAM1106 RNA causes inhibition of translation of respective one or more VGAM1106 host target proteins.

[40088] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1106 gene, herein designated VGAM GENE, on one or more VGAM1106 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[40089] It is yet further appreciated that a function of VGAM1106 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1106 include diagnosis, prevention and treatment of viral infection by Human Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM1106

correlate with, and may be deduced from, the identity of the host target genes which VGAM1106 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[40090] Nucleotide sequences of the VGAM1106 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1106 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1106 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1106 are further described hereinbelow with reference to Table 1.

[40091] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1106 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1106 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[40092] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1106 gene, herein designated VGAM is inhibition of expression of VGAM1106 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1106 correlate with, and may be deduced

from, the identity of the target genes which VGAM1106 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[40093] Paralemmin (PALM, Accession NM_002579) is a VGAM1106 host target gene. PALM BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PALM, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PALM BINDING SITE, designated SEQ ID:8437, to the nucleotide sequence of VGAM1106 RNA, herein designated VGAM RNA, also designated SEQ ID:3817.

[40094] A function of VGAM1106 is therefore inhibition of Paralemmin (PALM, Accession NM_002579). Accordingly, utilities of VGAM1106 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PALM. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1107 (VGAM1107) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes

is known in the art.

[40095] VGAM1107 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1107 was detected is described hereinabove with reference to Figs. 1–8.

[40096] VGAM1107 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Porcine Adenovirus C. VGAM1107 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[40097] VGAM1107 gene encodes a VGAM1107 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1107 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1107 precursor RNA is designated SEQ ID:1093, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1093 is located at position 3553 relative to the genome of Porcine Adenovirus C.

[40098] VGAM1107 precursor RNA folds onto itself, forming VGAM1107 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two–

dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[40099] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1107 folded precursor RNA into VGAM1107 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM1107 RNA is designated SEQ ID:3818, and is provided hereinbelow with reference to the sequence listing part.

[40100] VGAM1107 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1107 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1107 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein cod-

ing region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[40101] VGAM1107 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1107 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1107 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1107 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1107 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR

and 5`UTR regions.

[40102] The complementary binding of VGAM1107 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1107 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1107 host target RNA into VGAM1107 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[40103] It is appreciated that VGAM1107 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1107 host target genes. The mRNA of each one of this plurality of VGAM1107 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1107 RNA, herein designated VGAM RNA, and which when bound by VGAM1107 RNA causes inhibition of translation of respective one or more VGAM1107 host target proteins.

[40104] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1107 gene, herein designated VGAM GENE, on one

or more VGAM1107 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[40105] It is yet further appreciated that a function of VGAM1107 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1107 include diagnosis, prevention and treatment of viral infection by Porcine Adenovirus C. Specific functions, and accordingly utilities, of VGAM1107 correlate with, and may be deduced from, the identity of the host target genes which VGAM1107 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[40106] Nucleotide sequences of the VGAM1107 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1107 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1107 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1107 are further described hereinbelow with reference to Table 1.

[40107] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1107 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1107 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[40108] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1107 gene, herein designated VGAM is inhibition of expression of VGAM1107 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1107 correlate with, and may be deduced from, the identity of the target genes which VGAM1107 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[40109] APM1 (Accession NM_004797) is a VGAM1107 host target

gene. APM1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by APM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of APM1 BINDING SITE, designated SEQ ID:11207, to the nucleotide sequence of VGAM1107 RNA, herein designated VGAM RNA, also designated SEQ ID:3818.

[40110] A function of VGAM1107 is therefore inhibition of APM1 (Accession NM_004797). Accordingly, utilities of VGAM1107 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APM1. BAI1-associated Protein 3 (BAIAP3, Accession NM_003933) is another VGAM1107 host target gene. BAIAP3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BAIAP3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BAIAP3 BINDING SITE, designated SEQ ID:10036, to the nucleotide sequence of VGAM1107 RNA, herein designated VGAM RNA, also designated SEQ ID:3818.

[40111] Another function of VGAM1107 is therefore inhibition of BAI1-associated Protein 3 (BAIAP3, Accession NM_003933). Accordingly, utilities of VGAM1107 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BAIAP3. CD1D Antigen, D Polypeptide (CD1D, Accession XM_086610) is another VGAM1107 host target gene. CD1D BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CD1D, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CD1D BINDING SITE, designated SEQ ID:38790, to the nucleotide sequence of VGAM1107 RNA, herein designated VGAM RNA, also designated SEQ ID:3818.

[40112] Another function of VGAM1107 is therefore inhibition of CD1D Antigen, D Polypeptide (CD1D, Accession XM_086610), a gene which is a member D of the CD1 family; involved in antigen presentation . Accordingly, utilities of VGAM1107 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CD1D. The function of CD1D has been established by previous studies. Alpha-galactosylceramide

(alpha-GalCer), a marine sponge glycosphingolipid (GSL), and some disaccharide GSLs can be presented by CD1D in vitro without antigen-presenting cells (APCs) to NK T cells, which respond by producing interleukin-2 (IL2; 147680). Prigozy et al. (2001), however, found that sugars linked at the 2-prime or 3-prime position of the galactose must be removed by APCs in order to stimulate NK T cells. Immunofluorescence microscopy, supported by functional assays, showed that intact CD1D, but not cytoplasmic tail-deleted mutants lacking the endosomal-targeting motif, localized to lysosomes as well as to the plasma membrane, and could present 2-prime-linked alpha-GalGalCer to NK T cells. Such 2-prime-linked alpha-GalGalCer antigen presentation could be blocked by lysosomotropic inhibitors and specifically by an inhibitor of alpha-galactosidase A (GLA; 301500). Alternatively, alpha-galactosidase A-mediated removal of the terminal galactose permitted the presentation of the 2-prime-linked alpha-GalGalCer to NK T cells in the absence APCs. Prigozy et al. (2001) also found that splenic APCs from alpha-galactosidase A-deficient mice, a model of Fabry disease (OMIM Ref. No. 301500), could present alpha-GalCer or 6-prime-linked alpha-GalGalCer but not 2-prime-linked

alpha-GalGalCer to NK T-cell lines. Prigozy et al. (2001) concluded that the demonstration of a carbohydrate antigen-processing pathway could extend the range of antigens that are presented by CD1 molecules. Animal model experiments lend further support to the function of CD1D. Quantitative and qualitative defects in CD1-restricted natural killer T cells are found in autoimmune-prone strains of mice, including the nonobese diabetic (NOD) mouse. These defects appear to be associated with the emergence of spontaneous autoimmunity. Shi et al. (2001) demonstrated that CD1d-null NOD transgenic mice have accelerated onset and increased incidence of diabetes when compared with CD1d +/- and CD1d +/+ littermates. The pancreata of CD1d-null mice harbored significantly higher numbers of activated memory T cells expressing the chemokine receptor CCR4 (OMIM Ref. No. 604836). Notably, the presence of these T cells was associated with immunohistochemical evidence of increased destructive insulitis. Thus, CD1d-restricted T cells are critically important for regulation of the spontaneous disease process in NOD mice.

[40113] It is appreciated that the abovementioned animal model for CD1D is acknowledged by those skilled in the art as a

scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[40114] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[40115] Riese, R. J.; Shi, G.-P.; Villadangos, J.; Stetson, D.; Driessen, C.; Lennon-Dumenil, A.-M.; Chu, C.-L.; Naumov, Y.; Behar, S. M.; Ploegh, H.; Locksley, R.; Chapman, H. A. : Regulation of CD1 function and NK1.1+ T cell selection and maturation by cathepsin S. *Immunity* 15: 909-919, 2001. ; and

[40116] Prigozy, T. I.; Naidenko, O.; Qasba, P.; Elewaut, D.; Brossay, L.; Khurana, A.; Natori, T.; Koezuka, Y.; Kulkarni, A.; Kronenberg, M. : Glycolipid antigen processing for presentation b.

[40117] Further studies establishing the function and utilities of CD1D are found in John Hopkins OMIM database record ID 188410, and in cited publications numbered 9779-9781, 4748, 9782, 9783, 10279-9785, 219 and 9786 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. CDP-diacylglycerol Synthase (phosphatidate cytidylyltransferase) 2 (CDS2, Accession NM_003818) is another VGAM1107 host target gene.

CDS2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CDS2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDS2 BINDING SITE, designated SEQ ID:9910, to the nucleotide sequence of VGAM1107 RNA, herein designated VGAM RNA, also designated SEQ ID:3818.

[40118] Another function of VGAM1107 is therefore inhibition of CDP-diacylglycerol Synthase (phosphatidate cytidylyltransferase) 2 (CDS2, Accession NM_003818), a gene which is a key regulator of the amount of PIP2 available for signaling. Accordingly, utilities of VGAM1107 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDS2. The function of CDS2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM900. Diacylglycerol Kinase, Iota (DGKI, Accession NM_004717) is another VGAM1107 host target gene. DGKI BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DGKI, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DGKI BINDING SITE, designated SEQ ID:11081, to the nucleotide sequence of VGAM1107 RNA, herein designated VGAM RNA, also designated SEQ ID:3818.

[40119] Another function of VGAM1107 is therefore inhibition of Diacylglycerol Kinase, Iota (DGKI, Accession NM_004717), a gene which regulates the intracellular concentration of the second messenger diacylglycerol (DAG). Accordingly, utilities of VGAM1107 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DGKI. The function of DGKI has been established by previous studies. Diacylglycerol kinase (DGK) plays a key role in cellular processes by regulating the intracellular concentration of the second messenger diacylglycerol (DAG). For background information on the DGKs, see 125855. Type IV DGKs, such as DGK-zeta (OMIM Ref. No. 601441), contain 4 C-terminal ankyrin repeats and a MARCKS (OMIM Ref. No. 177061) homology domain. Mutations in the *Drosophila* *rdgA* (retinal degeneration A) gene, a type IV DGK also referred to as DGK2, lead to degeneration of photoreceptor cells and blindness (Masai et al., 1993). By searching an EST database for sequences re-

lated to DGK-zeta, Ding et al. (1998) identified a cDNA encoding a novel DGK that they designated DGK-iota. The predicted 1,065-amino acid DGK-iota protein is a type IV DGK that shares 63% and 40% amino acid identity with DGK-zeta and rdgA, respectively. When expressed in mammalian cells, the DGK-iota protein had an apparent molecular weight of 130 kD and exhibited DGK activity. DGK-iota was found in both the nucleus and the cytoplasm, but expression of protein kinase C-alpha (OMIM Ref. No. 176960) or -gamma (OMIM Ref. No. 176980) attenuated the nuclear localization. Ding et al. (1998) concluded that the nuclear localization of DGK-iota is regulated by phosphorylation in much the same manner as that of DGK-zeta. Northern blot and RT-PCR analyses revealed that the DGK-iota gene was expressed specifically in brain and retina as a predominant transcript of more than 12 kb, including a very long 3-prime untranslated region. Additional low abundance transcripts of 9.5 and 7.5 kb were also detected. By FISH, Ding et al. (1998) mapped the DGK-iota gene to 7q32.3-q33. They suggested that DGK-iota is a candidate gene for a dominant form of retinitis pigmentosa (RP10; 180105) that maps to a locus in the same region.

[40120] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[40121] Ding, L.; Traer, E.; McIntyre, T. M.; Zimmerman, G. A.; Prescott, S. M. : The cloning and characterization of a novel human diacylglycerol kinase, DGK- ι . J. Biol. Chem. 273: 32746–32752, 1998. ; and

[40122] Masai, I.; Okazaki, A.; Hosoya, T.; Hotta, Y. : Drosophila retinal degeneration A gene encodes an eye-specific diacylglycerol kinase with cysteine-rich zinc-finger motifs and ankyrin re.

[40123] Further studies establishing the function and utilities of DGKI are found in John Hopkins OMIM database record ID 604072, and in cited publications numbered 63 and 1267 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Fibronectin Leucine Rich Transmembrane Protein 2 (FLRT2, Accession NM_013231) is another VGAM1107 host target gene. FLRT2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLRT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-

quences of FLRT2 BINDING SITE, designated SEQ ID:14878, to the nucleotide sequence of VGAM1107 RNA, herein designated VGAM RNA, also designated SEQ ID:3818.

[40124] Another function of VGAM1107 is therefore inhibition of Fibronectin Leucine Rich Transmembrane Protein 2 (FLRT2, Accession NM_013231), a gene which may have a function in cell adhesion and/or receptor signaling. Accordingly, utilities of VGAM1107 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLRT2. The function of FLRT2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM247. Forkhead Box I1 (FOXI1, Accession NM_012188) is another VGAM1107 host target gene. FOXI1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FOXI1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FOXI1 BINDING SITE, designated SEQ ID:14475, to the nucleotide sequence of VGAM1107 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:3818.

[40125] Another function of VGAM1107 is therefore inhibition of Forkhead Box I1 (FOXI1, Accession NM_012188), a gene which plays an important role in the development of the cochlea and vestibulum, as well as embryogenesis. Accordingly, utilities of VGAM1107 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FOXI1. The function of FOXI1 has been established by previous studies. FKH10 is a member of the forkhead family of winged helix transcription regulators. The forkhead family is distinguished by a characteristic 100-amino acid motif that was originally identified in *Drosophila* (see OMIM Ref. No. 164874). Pierrou et al. (1994) identified 7 human genes containing a forkhead domain and designated them forkhead related activators (FREAC) 1 through 7. Northern blot analysis revealed that the FREAC6, or FKHL10, gene is expressed as a 2.3-kb mRNA only in kidney. Genes encoding forkhead proteins are instrumental during embryogenesis in mammals, in particular during development of the nervous system. Hu-lander et al. (1998) reported that mice with a targeted disruption of the *Fkh10* locus exhibit circling behavior, poor swimming ability, and abnormal reaching response,

all common findings in mice with vestibular dysfunction. These animals also failed to elicit a Preyer reflex in response to a suprathreshold auditory stimulation, as seen in mice with profound hearing impairment. Histologic examination of the inner ear revealed a gross structural malformation of the vestibulum as well as of the cochlea. These structures were replaced by a single irregular cavity in which neither proper semicircular ducts nor cochlea could be identified. Hulander et al. (1998) also showed that at 9.5 days postcoitum (DPC), Fkh10 was exclusively expressed in the otic vesicle. Larsson et al. (1995) showed that FKHL10 is expressed in the adult and fetal kidney, whereas 15 other tissues (which did not include any inner ear-derived samples) were negative. Kidney-specific expression had been observed also in the mouse. Although Fkh10 may play a role in the kidney during later stages of development, it may be a minor, or perhaps redundant, role, as no kidney dysfunction was observed in homozygous knockout mice. On the contrary, Fkh10 appears to be unique in the sense that it is an early otic vesicle-specific gene necessary for the development of both cochlea and vestibulum. These findings implicated Fkh10 as an early regulator necessary for development of both cochlea

and vestibulum and identified its human homolog FKHL10 as a previously unknown candidate deafness gene at 5q34. The phenotype described by Hulander et al. (1998) resembles a group of human congenital inner ear malformations called 'common cavity.' Hulander et al. (1998) proposed that mutations in FKH10 may cause a 'common cavity' phenotype in humans.

[40126] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[40127] Hulander, M.; Wurst, W.; Carlsson, P.; Enerback, S. : The winged helix transcription factor Fkh10 is required for normal development of the inner ear. Nature Genet. 20: 374–376, 1998. ; and

[40128] Larsson, C.; Hellqvist, M.; Pierrou, S.; White, I.; Enerback, S.; Carlsson, P. : Chromosomal localization of six human forkhead genes, freac–1 (FKHL5), –3 (FKHL7), –4 (FKHL8), –5 (FKHL9).

[40129] Further studies establishing the function and utilities of FOXI1 are found in John Hopkins OMIM database record ID 601093, and in cited publications numbered 9462–9460 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Glycoprotein A

Repetitions Predominant (GARP, Accession NM_005512) is another VGAM1107 host target gene. GARP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GARP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GARP BINDING SITE, designated SEQ ID:12031, to the nucleotide sequence of VGAM1107 RNA, herein designated VGAM RNA, also designated SEQ ID:3818.

[40130] Another function of VGAM1107 is therefore inhibition of Glycoprotein A Repetitions Predominant (GARP, Accession NM_005512). Accordingly, utilities of VGAM1107 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GARP. RNA (guanine-7-) Methyltransferase (RNMT, Accession NM_003799) is another VGAM1107 host target gene. RNMT BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RNMT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNMT BINDING SITE, designated SEQ ID:9883, to the nucleotide se-

quence of VGAM1107 RNA, herein designated VGAM RNA, also designated SEQ ID:3818.

[40131] Another function of VGAM1107 is therefore inhibition of RNA (guanine-7-) Methyltransferase (RNMT, Accession NM_003799), a gene which catalyzes the methylation of GpppN- at the guanine N7 position. Accordingly, utilities of VGAM1107 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNMT. The function of RNMT and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM178. Sphingosine Kinase 2 (SPHK2, Accession NM_020126) is another VGAM1107 host target gene. SPHK2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SPHK2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SPHK2 BINDING SITE, designated SEQ ID:21314, to the nucleotide sequence of VGAM1107 RNA, herein designated VGAM RNA, also designated SEQ ID:3818.

[40132] Another function of VGAM1107 is therefore inhibition of

Sphingosine Kinase 2 (SPHK2, Accession NM_020126). Accordingly, utilities of VGAM1107 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SPHK2. Chromosome 20 Open Reading Frame 20 (C20orf20, Accession NM_018270) is another VGAM1107 host target gene. C20orf20 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C20orf20, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf20 BINDING SITE, designated SEQ ID:20247, to the nucleotide sequence of VGAM1107 RNA, herein designated VGAM RNA, also designated SEQ ID:3818.

[40133] Another function of VGAM1107 is therefore inhibition of Chromosome 20 Open Reading Frame 20 (C20orf20, Accession NM_018270). Accordingly, utilities of VGAM1107 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf20. Chromosome 5 Open Reading Frame 6 (C5orf6, Accession NM_016605) is another VGAM1107 host target gene. C5orf6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

C5orf6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C5orf6 BINDING SITE, designated SEQ ID:18706, to the nucleotide sequence of VGAM1107 RNA, herein designated VGAM RNA, also designated SEQ ID:3818.

[40134] Another function of VGAM1107 is therefore inhibition of Chromosome 5 Open Reading Frame 6 (C5orf6, Accession NM_016605). Accordingly, utilities of VGAM1107 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C5orf6. CAP350 (Accession NM_014810) is another VGAM1107 host target gene. CAP350 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CAP350, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CAP350 BINDING SITE, designated SEQ ID:16772, to the nucleotide sequence of VGAM1107 RNA, herein designated VGAM RNA, also designated SEQ ID:3818.

[40135] Another function of VGAM1107 is therefore inhibition of

CAP350 (Accession NM_014810). Accordingly, utilities of VGAM1107 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAP350. Coactosin-like 1 (Dictyostelium) (COTL1, Accession XM_113840) is another VGAM1107 host target gene. COTL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by COTL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COTL1 BINDING SITE, designated SEQ ID:42468, to the nucleotide sequence of VGAM1107 RNA, herein designated VGAM RNA, also designated SEQ ID:3818.

[40136] Another function of VGAM1107 is therefore inhibition of Coactosin-like 1 (Dictyostelium) (COTL1, Accession XM_113840). Accordingly, utilities of VGAM1107 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COTL1. FEM-2 (Accession NM_014634) is another VGAM1107 host target gene. FEM-2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FEM-2, corresponding to a HOST TARGET binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FEM-2 BINDING SITE, designated SEQ ID:16007, to the nucleotide sequence of VGAM1107 RNA, herein designated VGAM RNA, also designated SEQ ID:3818.

[40137] Another function of VGAM1107 is therefore inhibition of FEM-2 (Accession NM_014634). Accordingly, utilities of VGAM1107 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FEM-2. FLJ10815 (Accession NM_018231) is another VGAM1107 host target gene. FLJ10815 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10815, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10815 BINDING SITE, designated SEQ ID:20169, to the nucleotide sequence of VGAM1107 RNA, herein designated VGAM RNA, also designated SEQ ID:3818.

[40138] Another function of VGAM1107 is therefore inhibition of FLJ10815 (Accession NM_018231). Accordingly, utilities of VGAM1107 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ10815. FLJ11783 (Accession NM_024891) is another VGAM1107 host target gene. FLJ11783 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ11783, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11783 BINDING SITE, designated SEQ ID:24366, to the nucleotide sequence of VGAM1107 RNA, herein designated VGAM RNA, also designated SEQ ID:3818.

[40139] Another function of VGAM1107 is therefore inhibition of FLJ11783 (Accession NM_024891). Accordingly, utilities of VGAM1107 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11783. FLJ20105 (Accession NM_017669) is another VGAM1107 host target gene. FLJ20105 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ20105, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20105 BINDING SITE, designated SEQ ID:19210, to the nucleotide

sequence of VGAM1107 RNA, herein designated VGAM RNA, also designated SEQ ID:3818.

[40140] Another function of VGAM1107 is therefore inhibition of FLJ20105 (Accession NM_017669). Accordingly, utilities of VGAM1107 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20105. FLJ20477 (Accession NM_017837) is another VGAM1107 host target gene. FLJ20477 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ20477, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20477 BINDING SITE, designated SEQ ID:19504, to the nucleotide sequence of VGAM1107 RNA, herein designated VGAM RNA, also designated SEQ ID:3818.

[40141] Another function of VGAM1107 is therefore inhibition of FLJ20477 (Accession NM_017837). Accordingly, utilities of VGAM1107 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20477. FLJ21736 (Accession NM_024922) is another VGAM1107 host target gene. FLJ21736 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by FLJ21736, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21736 BINDING SITE, designated SEQ ID:24458, to the nucleotide sequence of VGAM1107 RNA, herein designated VGAM RNA, also designated SEQ ID:3818.

[40142] Another function of VGAM1107 is therefore inhibition of FLJ21736 (Accession NM_024922). Accordingly, utilities of VGAM1107 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21736. FLJ22009 (Accession XM_015700) is another VGAM1107 host target gene. FLJ22009 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22009, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22009 BINDING SITE, designated SEQ ID:30245, to the nucleotide sequence of VGAM1107 RNA, herein designated VGAM RNA, also designated SEQ ID:3818.

[40143] Another function of VGAM1107 is therefore inhibition of FLJ22009 (Accession XM_015700). Accordingly, utilities of

VGAM1107 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22009. FLJ22419 (Accession NM_024697) is another VGAM1107 host target gene. FLJ22419 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ22419, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22419 BINDING SITE, designated SEQ ID:24007, to the nucleotide sequence of VGAM1107 RNA, herein designated VGAM RNA, also designated SEQ ID:3818.

[40144] Another function of VGAM1107 is therefore inhibition of FLJ22419 (Accession NM_024697). Accordingly, utilities of VGAM1107 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22419. H11 (Accession NM_014365) is another VGAM1107 host target gene. H11 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by H11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of H11 BINDING SITE, desig-

nated SEQ ID:15693, to the nucleotide sequence of VGAM1107 RNA, herein designated VGAM RNA, also designated SEQ ID:3818.

[40145] Another function of VGAM1107 is therefore inhibition of H11 (Accession NM_014365). Accordingly, utilities of VGAM1107 include diagnosis, prevention and treatment of diseases and clinical conditions associated with H11. Hairy/enhancer-of-split Related with YRPW Motif-like (HEYL, Accession NM_014571) is another VGAM1107 host target gene. HEYL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HEYL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HEYL BINDING SITE, designated SEQ ID:15928, to the nucleotide sequence of VGAM1107 RNA, herein designated VGAM RNA, also designated SEQ ID:3818.

[40146] Another function of VGAM1107 is therefore inhibition of Hairy/enhancer-of-split Related with YRPW Motif-like (HEYL, Accession NM_014571). Accordingly, utilities of VGAM1107 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HEYL.

KIAA0016 (Accession NM_014765) is another VGAM1107 host target gene. KIAA0016 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0016, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0016 BINDING SITE, designated SEQ ID:16530, to the nucleotide sequence of VGAM1107 RNA, herein designated VGAM RNA, also designated SEQ ID:3818.

[40147] Another function of VGAM1107 is therefore inhibition of KIAA0016 (Accession NM_014765). Accordingly, utilities of VGAM1107 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0016. PRO1048 (Accession NM_018497) is another VGAM1107 host target gene. PRO1048 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRO1048, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO1048 BINDING SITE, designated SEQ ID:20561, to the nucleotide sequence of VGAM1107 RNA, herein designated VGAM

RNA, also designated SEQ ID:3818.

[40148] Another function of VGAM1107 is therefore inhibition of PRO1048 (Accession NM_018497). Accordingly, utilities of VGAM1107 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO1048. Three Prime Repair Exonuclease 1 (TREX1, Accession NM_033627) is another VGAM1107 host target gene. TREX1 BINDING SITE1 and TREX1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by TREX1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TREX1 BINDING SITE1 and TREX1 BINDING SITE2, designated SEQ ID:27340 and SEQ ID:27347 respectively, to the nucleotide sequence of VGAM1107 RNA, herein designated VGAM RNA, also designated SEQ ID:3818.

[40149] Another function of VGAM1107 is therefore inhibition of Three Prime Repair Exonuclease 1 (TREX1, Accession NM_033627). Accordingly, utilities of VGAM1107 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TREX1. LOC143785 (Accession XM_084635) is another VGAM1107 host target

gene. LOC143785 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC143785, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143785 BINDING SITE, designated SEQ ID:37632, to the nucleotide sequence of VGAM1107 RNA, herein designated VGAM RNA, also designated SEQ ID:3818.

[40150] Another function of VGAM1107 is therefore inhibition of LOC143785 (Accession XM_084635). Accordingly, utilities of VGAM1107 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143785. LOC146714 (Accession XM_097072) is another VGAM1107 host target gene. LOC146714 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC146714, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146714 BINDING SITE, designated SEQ ID:40719, to the nucleotide sequence of VGAM1107 RNA, herein designated VGAM RNA, also designated SEQ ID:3818.

[40151] Another function of VGAM1107 is therefore inhibition of LOC146714 (Accession XM_097072). Accordingly, utilities of VGAM1107 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146714. LOC149301 (Accession XM_086480) is another VGAM1107 host target gene. LOC149301 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149301, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149301 BINDING SITE, designated SEQ ID:38692, to the nucleotide sequence of VGAM1107 RNA, herein designated VGAM RNA, also designated SEQ ID:3818.

[40152] Another function of VGAM1107 is therefore inhibition of LOC149301 (Accession XM_086480). Accordingly, utilities of VGAM1107 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149301. LOC151277 (Accession XM_087155) is another VGAM1107 host target gene. LOC151277 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC151277, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151277 BINDING SITE, designated SEQ ID:39094, to the nucleotide sequence of VGAM1107 RNA, herein designated VGAM RNA, also designated SEQ ID:3818.

[40153] Another function of VGAM1107 is therefore inhibition of LOC151277 (Accession XM_087155). Accordingly, utilities of VGAM1107 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151277. LOC221486 (Accession XM_165760) is another VGAM1107 host target gene. LOC221486 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC221486, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221486 BINDING SITE, designated SEQ ID:43742, to the nucleotide sequence of VGAM1107 RNA, herein designated VGAM RNA, also designated SEQ ID:3818.

[40154] Another function of VGAM1107 is therefore inhibition of LOC221486 (Accession XM_165760). Accordingly, utilities of VGAM1107 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC221486. LOC254205 (Accession XM_172962) is another VGAM1107 host target gene. LOC254205 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC254205, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254205 BINDING SITE, designated SEQ ID:46219, to the nucleotide sequence of VGAM1107 RNA, herein designated VGAM RNA, also designated SEQ ID:3818.

[40155] Another function of VGAM1107 is therefore inhibition of LOC254205 (Accession XM_172962). Accordingly, utilities of VGAM1107 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254205. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1108 (VGAM1108) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[40156] VGAM1108 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM1108 was detected is described hereinabove with reference to Figs. 1–8.

[40157] VGAM1108 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Chimpanzee Cytomegalovirus. VGAM1108 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[40158] VGAM1108 gene encodes a VGAM1108 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1108 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1108 precursor RNA is designated SEQ ID:1094, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1094 is located at position 30191 relative to the genome of Chimpanzee Cytomegalovirus.

[40159] VGAM1108 precursor RNA folds onto itself, forming VGAM1108 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide

sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[40160] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1108 folded precursor RNA into VGAM1108 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 71%) nucleotide sequence of VGAM1108 RNA is designated SEQ ID:3819, and is provided hereinbelow with reference to the sequence listing part.

[40161] VGAM1108 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1108 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1108 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[40162] VGAM1108 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM1108 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1108 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1108 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1108 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[40163] The complementary binding of VGAM1108 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM1108 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1108 host target RNA into VGAM1108 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[40164] It is appreciated that VGAM1108 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1108 host target genes. The mRNA of each one of this plurality of VGAM1108 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1108 RNA, herein designated VGAM RNA, and which when bound by VGAM1108 RNA causes inhibition of translation of respective one or more VGAM1108 host target proteins.

[40165] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1108 gene, herein designated VGAM GENE, on one or more VGAM1108 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[40166] It is yet further appreciated that a function of VGAM1108 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1108 include diagnosis, prevention and treatment of viral infection by Chimpanzee Cytomegalovirus. Specific functions, and accordingly utilities, of VGAM1108 correlate with, and may be deduced from, the identity of the host target genes which VGAM1108 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[40167] Nucleotide sequences of the VGAM1108 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1108 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM1108 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1108 are further described hereinbelow with reference to Table 1.

[40168] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1108 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1108 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[40169] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1108 gene, herein designated VGAM is inhibition of expression of VGAM1108 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1108 correlate with, and may be deduced from, the identity of the target genes which VGAM1108 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[40170] Potassium Inwardly-rectifying Channel, Subfamily J, Member 5 (KCNJ5, Accession NM_000890) is a VGAM1108 host target gene. KCNJ5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded

by KCNJ5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNJ5 BINDING SITE, designated SEQ ID:6587, to the nucleotide sequence of VGAM1108 RNA, herein designated VGAM RNA, also designated SEQ ID:3819.

[40171] A function of VGAM1108 is therefore inhibition of Potassium Inwardly-rectifying Channel, Subfamily J, Member 5 (KCNJ5, Accession NM_000890), a gene which is a potassium inwardly-rectifying channel. Accordingly, utilities of VGAM1108 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNJ5. The function of KCNJ5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM766.FLJ10352 (Accession NM_032142) is another VGAM1108 host target gene. FLJ10352 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10352, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10352

BINDING SITE, designated SEQ ID:25826, to the nucleotide sequence of VGAM1108 RNA, herein designated VGAM RNA, also designated SEQ ID:3819.

[40172] Another function of VGAM1108 is therefore inhibition of FLJ10352 (Accession NM_032142). Accordingly, utilities of VGAM1108 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10352. KIAA0254 (Accession NM_014758) is another VGAM1108 host target gene. KIAA0254 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0254, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0254 BINDING SITE, designated SEQ ID:16506, to the nucleotide sequence of VGAM1108 RNA, herein designated VGAM RNA, also designated SEQ ID:3819.

[40173] Another function of VGAM1108 is therefore inhibition of KIAA0254 (Accession NM_014758). Accordingly, utilities of VGAM1108 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0254. N4BP3 (Accession XM_038920) is another VGAM1108 host target gene. N4BP3 BINDING SITE is HOST

TARGET binding site found in the 3' untranslated region of mRNA encoded by N4BP3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of N4BP3 BINDING SITE, designated SEQ ID:32938, to the nucleotide sequence of VGAM1108 RNA, herein designated VGAM RNA, also designated SEQ ID:3819.

[40174] Another function of VGAM1108 is therefore inhibition of N4BP3 (Accession XM_038920). Accordingly, utilities of VGAM1108 include diagnosis, prevention and treatment of diseases and clinical conditions associated with N4BP3. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1109 (VGAM1109) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[40175] VGAM1109 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1109 was detected is described hereinabove with reference to Figs. 1-8.

[40176] VGAM1109 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Chimpanzee Cytomegalovirus. VGAM1109 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[40177] VGAM1109 gene encodes a VGAM1109 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1109 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1109 precursor RNA is designated SEQ ID:1095, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1095 is located at position 33182 relative to the genome of Chimpanzee Cytomegalovirus.

[40178] VGAM1109 precursor RNA folds onto itself, forming VGAM1109 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[40179] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1109 folded precursor RNA into VGAM1109 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1109 RNA is designated SEQ ID:3820, and is provided hereinbelow with reference to the sequence listing part.

[40180] VGAM1109 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1109 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1109 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[40181] VGAM1109 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1109 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM1109 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1109 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1109 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[40182] The complementary binding of VGAM1109 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1109 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1109

host target RNA into VGAM1109 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[40183] It is appreciated that VGAM1109 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1109 host target genes. The mRNA of each one of this plurality of VGAM1109 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1109 RNA, herein designated VGAM RNA, and which when bound by VGAM1109 RNA causes inhibition of translation of respective one or more VGAM1109 host target proteins.

[40184] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1109 gene, herein designated VGAM GENE, on one or more VGAM1109 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[40185] It is yet further appreciated that a function of VGAM1109 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1109 include diagnosis, prevention and treatment of viral infection by Chimpanzee Cytomegalovirus. Specific functions, and accordingly utilities, of VGAM1109 correlate with, and may be deduced from, the identity of the host target genes which VGAM1109 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[40186] Nucleotide sequences of the VGAM1109 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1109 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1109 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1109 are further

described hereinbelow with reference to Table 1.

[40187] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1109 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1109 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[40188] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1109 gene, herein designated VGAM is inhibition of expression of VGAM1109 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1109 correlate with, and may be deduced from, the identity of the target genes which VGAM1109 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[40189] Laminin, Beta 1 (LAMB1, Accession NM_002291) is a VGAM1109 host target gene. LAMB1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LAMB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LAMB1 BIND-

ING SITE, designated SEQ ID:8072, to the nucleotide sequence of VGAM1109 RNA, herein designated VGAM RNA, also designated SEQ ID:3820.

[40190] A function of VGAM1109 is therefore inhibition of Laminin, Beta 1 (LAMB1, Accession NM_002291), a gene which mediates the attachment, migration, and organization of cells into tissues. Accordingly, utilities of VGAM1109 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LAMB1. The function of LAMB1 has been established by previous studies. The major components of basal laminae are the glycoproteins laminin and collagen IV, both of which are heterotrimers. Laminin is a cruciform protein trimer of chains that when originally isolated from the extracellular matrix of tumor cells, were named A, B1, and B2, but were renamed alpha-1, beta-1, and gamma-1, respectively (Burgeson et al., 1994). The laminin and collagen IV isoforms vary from one basal lamina to another and are members of multigene families. These gene families (like others, such as the globins and myosins) may provide a means of generating functional diversity within a common structural framework. Modi et al. (1987) mapped the LAMB1 locus to 7q31.1-q31.3 by Southern blot analysis of

somatic cell hybrids and by in situ hybridization. On the other hand, by the same methods, Pikkarainen et al. (1987) placed LAMB1 in the 7q22 band. Jaye et al. (1987) regionalized LAMB1 to band 7q31 by somatic cell hybridization and in situ hybridization. Bonneau et al. (1991) described an infant with cutis laxa, emphysema, striking cardiac abnormalities and a diaphragmatic hernia leading to death at the age of 22 weeks. The infant had mild contractures at the elbows, hips, and knees, with bilateral hip dislocation. Arachnodactyly was striking. Chromosome studies showed a chromatid break at the junction of 7q31.3 and 7q32. Among 17 previously reported cases with the same syndrome, 1 was found to have a translocation involving 7q31 (Huret et al., 1991). Bonneau et al. (1991) called the condition neonatal cutis laxa with marfanoid phenotype. The clinical features and the location of the chromosomal change prompted Bonneau et al. (1991) to study laminin, which, by use of anti-human laminin antiserum, was found to be absent from the basement membranes of capillaries and the dermal-epidermal junction. Fibronectin was also not detected in the skin sample. Laminin B1 (OMIM Ref. No. 150240) maps to the same region of 7q. Bonneau et al. (1991) pointed to reports of

some 12 cases of neonatal 'Marfan syndrome' which might represent this same syndrome. These included the cases of Neimann et al. (1968), Hohn and Webb (1971), Lababidi and Monzon (1981), Buchanan and Wyatt (1985), Day and Burke (1986), and Gross et al. (1989). In a note added in proof, Bonneau et al. (1991) stated that studies of the case published by Neimann et al. (1968) showed deficiency of laminin in the basement membranes. Burgeson et al. (1994), a group of 14 leading researchers in the field of connective tissue proteins, adopted a new nomenclature for the laminins. They were numbered with arabic numerals in the order discovered. The previous A, B1, and B2 chains, and their isoforms, are alpha, beta, and gamma, respectively, followed by an arabic numeral to identify the isoform. For example, the first laminin identified from the Engelbreth-Holm-Swarm tumor (EHS) was designated laminin-1 with the chain composition alpha-1/beta-1/gamma-1. The genes for these 3 chains are LAMA1 (OMIM Ref. No. 150320), LAMB1, and LAMC1 (OMIM Ref. No. 150290).

[40191] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

- [40192] Burgeson, R. E.; Chiquet, M.; Deutzmann, R.; Ekblom, P.; Engel, J.; Kleinman, H.; Martin, G. R.; Meneguzzi, G.; Paulsson, M.; Sanes, J.; Timpl, R.; Tryggvason, K.; Yamada, Y.; Yurchenco, P. D. : A new nomenclature for the laminins. *Matrix Biol.* 14: 209–211, 1994. ; and
- [40193] Bonneau, D.; Huret, J. L.; Godeau, G.; Couet, D.; Putterman, M.; Tanzer, J.; Babin, P.; Larregue, M. : Recurrent *ctb(7)(q31.3)* and possible laminin involvement in a neonatal cutis laxa w.
- [40194] Further studies establishing the function and utilities of LAMB1 are found in John Hopkins OMIM database record ID 150240, and in cited publications numbered 11980–11998 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. LOC90719 (Accession XM_033704) is another VGAM1109 host target gene. LOC90719 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC90719, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90719 BINDING SITE, designated SEQ ID:31947, to the nucleotide sequence of VGAM1109 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3820.

[40195] Another function of VGAM1109 is therefore inhibition of LOC90719 (Accession XM_033704). Accordingly, utilities of VGAM1109 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90719. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1110 (VGAM1110) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[40196] VGAM1110 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1110 was detected is described hereinabove with reference to Figs. 1–8.

[40197] VGAM1110 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Duck Adenovirus 1. VGAM1110 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[40198] VGAM1110 gene encodes a VGAM1110 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM1110 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1110 precursor RNA is designated SEQ ID:1096, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1096 is located at position 8004 relative to the genome of Duck Adenovirus 1.

[40199] VGAM1110 precursor RNA folds onto itself, forming VGAM1110 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[40200] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1110 folded precursor RNA into VGAM1110 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1110 RNA is designated SEQ ID:3821, and is provided hereinbelow with reference to the sequence listing part.

[40201] VGAM1110 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1110 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1110 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[40202] VGAM1110 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1110 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1110 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1110 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1110 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[40203] The complementary binding of VGAM1110 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1110 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1110 host target RNA into VGAM1110 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[40204] It is appreciated that VGAM1110 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1110 host target genes. The mRNA of

each one of this plurality of VGAM1110 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1110 RNA, herein designated VGAM RNA, and which when bound by VGAM1110 RNA causes inhibition of translation of respective one or more VGAM1110 host target proteins.

[40205] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1110 gene, herein designated VGAM GENE, on one or more VGAM1110 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[40206] It is yet further appreciated that a function of VGAM1110 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1110 include diagnosis, prevention and treatment of viral infection by Duck Adenovirus 1. Specific functions, and accordingly utilities, of VGAM1110 correlate with, and may be deduced from, the identity of the host target genes which VGAM1110 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[40207] Nucleotide sequences of the VGAM1110 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1110 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1110 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1110 are further described hereinbelow with reference to Table 1.

[40208] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1110 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1110 RNA,

herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[40209] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1110 gene, herein designated VGAM is inhibition of expression of VGAM1110 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1110 correlate with, and may be deduced from, the identity of the target genes which VGAM1110 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[40210] Cytoplasmic FMR1 Interacting Protein 2 (CYFIP2, Accession XM_056963) is a VGAM1110 host target gene. CYFIP2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CYFIP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CYFIP2 BINDING SITE, designated SEQ ID:36439, to the nucleotide sequence of VGAM1110 RNA, herein designated VGAM RNA, also designated SEQ ID:3821.

[40211] A function of VGAM1110 is therefore inhibition of Cytoplasmic FMR1 Interacting Protein 2 (CYFIP2, Accession XM_056963). Accordingly, utilities of VGAM1110 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with CYFIP2. Retinoic Acid Induced 14 (RAI14, Accession NM_015577) is another VGAM1110 host target gene. RAI14 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RAI14, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAI14 BINDING SITE, designated SEQ ID:17846, to the nucleotide sequence of VGAM1110 RNA, herein designated VGAM RNA, also designated SEQ ID:3821.

[40212] Another function of VGAM1110 is therefore inhibition of Retinoic Acid Induced 14 (RAI14, Accession NM_015577), a gene which is required for protein transport from the ER to the Golgi complex. Accordingly, utilities of VGAM1110 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAI14. The function of RAI14 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1036. Tumor Protein P63 (TP63, Accession NM_003722) is another VGAM1110 host target gene.

TP63 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TP63, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TP63 BINDING SITE, designated SEQ ID:9816, to the nucleotide sequence of VGAM1110 RNA, herein designated VGAM RNA, also designated SEQ ID:3821.

[40213] Another function of VGAM1110 is therefore inhibition of Tumor Protein P63 (TP63, Accession NM_003722). Accordingly, utilities of VGAM1110 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TP63. WW Domain Containing Oxidoreductase (WWOX, Accession NM_016373) is another VGAM1110 host target gene. WWOX BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by WWOX, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WWOX BINDING SITE, designated SEQ ID:18504, to the nucleotide sequence of VGAM1110 RNA, herein designated VGAM RNA, also designated SEQ ID:3821.

[40214] Another function of VGAM1110 is therefore inhibition of WW Domain Containing Oxidoreductase (WWOX, Accession NM_016373), a gene which involves in protein-protein interactions and may contribute to the biologic consequences of DNA instability. Accordingly, utilities of VGAM1110 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WWOX. The function of WWOX and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM644.DKFZP434N1511 (Accession XM_166138) is another VGAM1110 host target gene. DKFZP434N1511 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DKFZP434N1511, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434N1511 BINDING SITE, designated SEQ ID:43938, to the nucleotide sequence of VGAM1110 RNA, herein designated VGAM RNA, also designated SEQ ID:3821.

[40215] Another function of VGAM1110 is therefore inhibition of DKFZP434N1511 (Accession XM_166138). Accordingly,

utilities of VGAM1110 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434N1511. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1111 (VGAM1111) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[40216] VGAM1111 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1111 was detected is described hereinabove with reference to Figs. 1-8.

[40217] VGAM1111 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox Virus. VGAM1111 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[40218] VGAM1111 gene encodes a VGAM1111 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1111 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nu-

cleotide sequence of VGAM1111 precursor RNA is designated SEQ ID:1097, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1097 is located at position 103122 relative to the genome of Camelpox Virus.

[40219] VGAM1111 precursor RNA folds onto itself, forming VGAM1111 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[40220] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1111 folded precursor RNA into VGAM1111 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 65%) nucleotide sequence of VGAM1111 RNA is designated SEQ ID:3822, and

is provided hereinbelow with reference to the sequence listing part.

[40221] VGAM1111 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1111 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1111 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[40222] VGAM1111 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1111 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1111 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing – VGAM1111 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1111 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[40223] The complementary binding of VGAM1111 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1111 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1111 host target RNA into VGAM1111 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[40224] It is appreciated that VGAM1111 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1111 host target genes. The mRNA of each one of this plurality of VGAM1111 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com–

plementary to VGAM1111 RNA, herein designated VGAM RNA, and which when bound by VGAM1111 RNA causes inhibition of translation of respective one or more VGAM1111 host target proteins.

[40225] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1111 gene, herein designated VGAM GENE, on one or more VGAM1111 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[40226] It is yet further appreciated that a function of VGAM1111 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1111 include diagnosis, prevention and treatment of viral infection by Camelpox Virus. Specific functions, and accordingly utilities, of VGAM1111 correlate with, and may be deduced from, the identity of the host target genes which VGAM1111 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[40227] Nucleotide sequences of the VGAM1111 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1111 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1111 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1111 are further described hereinbelow with reference to Table 1.

[40228] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1111 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1111 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[40229] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM1111 gene, herein designated VGAM is inhibition of expression of VGAM1111 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1111 correlate with, and may be deduced from, the identity of the target genes which VGAM1111 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[40230] ATPase, Ca++ Transporting, Type 2C, Member 1 (ATP2C1, Accession NM_014382) is a VGAM1111 host target gene. ATP2C1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ATP2C1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP2C1 BINDING SITE, designated SEQ ID:15717, to the nucleotide sequence of VGAM1111 RNA, herein designated VGAM RNA, also designated SEQ ID:3822.

[40231] A function of VGAM1111 is therefore inhibition of ATPase, Ca++ Transporting, Type 2C, Member 1 (ATP2C1, Accession NM_014382). Accordingly, utilities of VGAM1111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP2C1. Go-

nadotropin-releasing Hormone Receptor (GNRHR, Accession NM_000406) is another VGAM1111 host target gene. GNRHR BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by GNRHR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GNRHR BINDING SITE, designated SEQ ID:5982, to the nucleotide sequence of VGAM1111 RNA, herein designated VGAM RNA, also designated SEQ ID:3822.

[40232] Another function of VGAM1111 is therefore inhibition of Gonadotropin-releasing Hormone Receptor (GNRHR, Accession NM_000406), a gene which stimulates the secretionstimulates phosphoinositide turnover and membrane depolarization. Accordingly, utilities of VGAM1111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GNRHR. The function of GNRHR and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM638. Mucin 3B (MUC3B, Accession XM_168578) is another VGAM1111 host target gene. MUC3B BINDING SITE is HOST TARGET binding site found in the 5` un-

translated region of mRNA encoded by MUC3B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MUC3B BINDING SITE, designated SEQ ID:45256, to the nucleotide sequence of VGAM1111 RNA, herein designated VGAM RNA, also designated SEQ ID:3822.

[40233] Another function of VGAM1111 is therefore inhibition of Mucin 3B (MUC3B, Accession XM_168578), a gene which provides a protective, lubricating barrier against particles and infectious agents at mucosal surfaces. Accordingly, utilities of VGAM1111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MUC3B. The function of MUC3B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM55. Polymerase (DNA directed) Sigma (POLS, Accession NM_006999) is another VGAM1111 host target gene. POLS BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by POLS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of POLS BINDING SITE, designated SEQ ID:13863, to the nucleotide sequence of VGAM1111 RNA, herein designated VGAM RNA, also designated SEQ ID:3822.

[40234] Another function of VGAM1111 is therefore inhibition of Polymerase (DNA directed) Sigma (POLS, Accession NM_006999), a gene which is necessary for chromosome segregation. Accordingly, utilities of VGAM1111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with POLS. The function of POLS and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM106.KIAA1161 (Accession XM_088501) is another VGAM1111 host target gene. KIAA1161 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1161, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1161 BINDING SITE, designated SEQ ID:39745, to the nucleotide sequence of VGAM1111 RNA, herein designated VGAM RNA, also designated SEQ ID:3822.

[40235] Another function of VGAM1111 is therefore inhibition of KIAA1161 (Accession XM_088501). Accordingly, utilities of VGAM1111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1161. Kelch-like 6 (Drosophila) (KLHL6, Accession NM_130446) is another VGAM1111 host target gene. KLHL6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KLHL6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KLHL6 BINDING SITE, designated SEQ ID:28213, to the nucleotide sequence of VGAM1111 RNA, herein designated VGAM RNA, also designated SEQ ID:3822.

[40236] Another function of VGAM1111 is therefore inhibition of Kelch-like 6 (Drosophila) (KLHL6, Accession NM_130446). Accordingly, utilities of VGAM1111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KLHL6. RAS Protein Activator Like 2 (RASAL2, Accession NM_004841) is another VGAM1111 host target gene. RASAL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA

encoded by RASAL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RASAL2 BINDING SITE, designated SEQ ID:11251, to the nucleotide sequence of VGAM1111 RNA, herein designated VGAM RNA, also designated SEQ ID:3822.

[40237] Another function of VGAM1111 is therefore inhibition of RAS Protein Activator Like 2 (RASAL2, Accession NM_004841). Accordingly, utilities of VGAM1111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RASAL2. Small Nuclear RNA Activating Complex, Polypeptide 1, 43kDa (SNAPC1, Accession NM_003082) is another VGAM1111 host target gene. SNAPC1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SNAPC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SNAPC1 BINDING SITE, designated SEQ ID:9056, to the nucleotide sequence of VGAM1111 RNA, herein designated VGAM RNA, also designated SEQ ID:3822.

[40238] Another function of VGAM1111 is therefore inhibition of Small Nuclear RNA Activating Complex, Polypeptide 1, 43kDa (SNAPC1, Accession NM_003082). Accordingly, utilities of VGAM1111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNAPC1. LOC149483 (Accession XM_086537) is another VGAM1111 host target gene. LOC149483 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149483, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149483 BINDING SITE, designated SEQ ID:38757, to the nucleotide sequence of VGAM1111 RNA, herein designated VGAM RNA, also designated SEQ ID:3822.

[40239] Another function of VGAM1111 is therefore inhibition of LOC149483 (Accession XM_086537). Accordingly, utilities of VGAM1111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149483. LOC150397 (Accession XM_086907) is another VGAM1111 host target gene. LOC150397 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150397, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150397 BINDING SITE, designated SEQ ID:38957, to the nucleotide sequence of VGAM1111 RNA, herein designated VGAM RNA, also designated SEQ ID:3822.

[40240] Another function of VGAM1111 is therefore inhibition of LOC150397 (Accession XM_086907). Accordingly, utilities of VGAM1111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150397. LOC152627 (Accession XM_087495) is another VGAM1111 host target gene. LOC152627 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC152627, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152627 BINDING SITE, designated SEQ ID:39291, to the nucleotide sequence of VGAM1111 RNA, herein designated VGAM RNA, also designated SEQ ID:3822.

[40241] Another function of VGAM1111 is therefore inhibition of LOC152627 (Accession XM_087495). Accordingly, utilities of VGAM1111 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC152627. LOC219529 (Accession XM_167563) is another VGAM1111 host target gene. LOC219529 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC219529, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219529 BINDING SITE, designated SEQ ID:44672, to the nucleotide sequence of VGAM1111 RNA, herein designated VGAM RNA, also designated SEQ ID:3822.

[40242] Another function of VGAM1111 is therefore inhibition of LOC219529 (Accession XM_167563). Accordingly, utilities of VGAM1111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219529. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1112 (VGAM1112) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[40243] VGAM1112 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1112 was detected is described hereinabove with reference to Figs. 1–8.

[40244] VGAM1112 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox Virus.

VGAM1112 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[40245] VGAM1112 gene encodes a VGAM1112 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1112 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1112 precursor RNA is designated SEQ ID:1098, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1098 is located at position 103458 relative to the genome of Camelpox Virus.

[40246] VGAM1112 precursor RNA folds onto itself, forming VGAM1112 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by

miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[40247] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1112 folded precursor RNA into VGAM1112 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM1112 RNA is designated SEQ ID:3823, and is provided hereinbelow with reference to the sequence listing part.

[40248] VGAM1112 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1112 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1112 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[40249] VGAM1112 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1112 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1112 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1112 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1112 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[40250] The complementary binding of VGAM1112 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM1112 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1112 host target RNA into VGAM1112 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[40251] It is appreciated that VGAM1112 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1112 host target genes. The mRNA of each one of this plurality of VGAM1112 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1112 RNA, herein designated VGAM RNA, and which when bound by VGAM1112 RNA causes inhibition of translation of respective one or more VGAM1112 host target proteins.

[40252] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1112 gene, herein designated VGAM GENE, on one or more VGAM1112 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[40253] It is yet further appreciated that a function of VGAM1112 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1112 include diagnosis, prevention and treatment of viral infection by Camelpox Virus. Specific functions, and accordingly utilities, of VGAM1112 correlate with, and may be deduced from, the identity of the host target genes which VGAM1112 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[40254] Nucleotide sequences of the VGAM1112 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM1112 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1112 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1112 are further described hereinbelow with reference to Table 1.

[40255] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1112 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1112 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[40256] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1112 gene, herein designated VGAM is inhibition of expression of VGAM1112 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1112 correlate with, and may be deduced from, the identity of the target genes which VGAM1112 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[40257] DKFZP434J193 (Accession XM_048452) is a VGAM1112 host target gene. DKFZP434J193 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region

of mRNA encoded by DKFZP434J193, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434J193 BINDING SITE, designated SEQ ID:35161, to the nucleotide sequence of VGAM1112 RNA, herein designated VGAM RNA, also designated SEQ ID:3823.

[40258] A function of VGAM1112 is therefore inhibition of DKFZP434J193 (Accession XM_048452). Accordingly, utilities of VGAM1112 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434J193. KIAA1548 (Accession NM_020909) is another VGAM1112 host target gene. KIAA1548 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1548, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1548 BINDING SITE, designated SEQ ID:21927, to the nucleotide sequence of VGAM1112 RNA, herein designated VGAM RNA, also designated SEQ ID:3823.

[40259] Another function of VGAM1112 is therefore inhibition of KIAA1548 (Accession NM_020909). Accordingly, utilities

of VGAM1112 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1548. LOC150998 (Accession XM_097990) is another VGAM1112 host target gene. LOC150998 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150998, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150998 BINDING SITE, designated SEQ ID:41287, to the nucleotide sequence of VGAM1112 RNA, herein designated VGAM RNA, also designated SEQ ID:3823.

[40260] Another function of VGAM1112 is therefore inhibition of LOC150998 (Accession XM_097990). Accordingly, utilities of VGAM1112 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150998. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1113 (VGAM1113) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[40261] VGAM1113 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1113 was detected is described hereinabove with reference to Figs. 1–8.

[40262] VGAM1113 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox Virus. VGAM1113 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[40263] VGAM1113 gene encodes a VGAM1113 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1113 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1113 precursor RNA is designated SEQ ID:1099, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1099 is located at position 103649 relative to the genome of Camelpox Virus.

[40264] VGAM1113 precursor RNA folds onto itself, forming VGAM1113 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the

art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[40265] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1113 folded precursor RNA into VGAM1113 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1113 RNA is designated SEQ ID:3824, and is provided hereinbelow with reference to the sequence listing part.

[40266] VGAM1113 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1113 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1113 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated

5`UTR, PROTEIN CODING and 3`UTR respectively.

[40267] VGAM1113 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1113 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1113 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1113 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1113 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[40268] The complementary binding of VGAM1113 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1113 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1113 host target RNA into VGAM1113 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[40269] It is appreciated that VGAM1113 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1113 host target genes. The mRNA of each one of this plurality of VGAM1113 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1113 RNA, herein designated VGAM RNA, and which when bound by VGAM1113 RNA causes inhibition of translation of respective one or more VGAM1113 host target proteins.

[40270] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1113 gene, herein designated VGAM GENE, on one or more VGAM1113 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[40271] It is yet further appreciated that a function of VGAM1113 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1113 include diagnosis, prevention and treatment of viral infection by Camelpox Virus. Specific functions, and accordingly utilities, of VGAM1113 correlate with, and may be deduced from, the identity of the host target genes which VGAM1113 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[40272] Nucleotide sequences of the VGAM1113 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the
`diced` VGAM1113 RNA, herein designated VGAM RNA,
and a schematic representation of the secondary folding
of VGAM1113 folded precursor RNA, herein designated
VGAM FOLDED PRECURSOR RNA, of VGAM1113 are further
described hereinbelow with reference to Table 1.

[40273] Nucleotide sequences of host target binding sites, such as
BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of
Fig. 1, found on VGAM1113 host target RNA, and
schematic representation of the complementarity of each
of these host target binding sites to VGAM1113 RNA,
herein designated VGAM RNA, are described hereinbelow
with reference to Table 2.

[40274] As mentioned hereinabove with reference to Fig. 1, a
function of VGAM1113 gene, herein designated VGAM is
inhibition of expression of VGAM1113 target genes. It is
appreciated that specific functions, and accordingly utili-
ties, of VGAM1113 correlate with, and may be deduced
from, the identity of the target genes which VGAM1113
binds and inhibits, and the function of these target genes,
as elaborated hereinbelow.

[40275] Adenylate Kinase 2 (AK2, Accession NM_013411) is a
VGAM1113 host target gene. AK2 BINDING SITE is HOST

TARGET binding site found in the 3' untranslated region of mRNA encoded by AK2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AK2 BINDING SITE, designated SEQ ID:15075, to the nucleotide sequence of VGAM1113 RNA, herein designated VGAM RNA, also designated SEQ ID:3824.

[40276] A function of VGAM1113 is therefore inhibition of Adenylate Kinase 2 (AK2, Accession NM_013411), a gene which essential for maintenance and cell growth. Accordingly, utilities of VGAM1113 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AK2. The function of AK2 has been established by previous studies. The existence of a second adenylate kinase (EC 2.7.4.3) locus linked to PGM1 and peptidase C, i.e., on chromosome 1, was suggested by cell hybridization studies by Van Cong et al. (1972). The Goss-Harris method of mapping combines features of recombinational study in families and syntenic tests in hybrid cells. As applied to chromosome 1, the method shows that AK2 and UMPK are distal to PGM1 and that the order of the loci is PGM1: UMPK: (AK2, alpha-FUC): ENO1 (Goss and Harris,

1977). Carritt et al. (1982) presented evidence that AK2 is in 1p34.

[40277] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[40278] Goss, S. J.; Harris, H. : Gene transfer by means of cell fusion. II. The mapping of 8 loci on human chromosome 1 by statistical analysis of gene assortment in somatic cell hybrids. J. Cell Sci. 25: 39–57, 1977. ; and

[40279] Carritt, B.; King, J.; Welch, H. M. : Gene order and localization of enzyme loci on the short arm of chromosome 1. Ann. Hum. Genet. 46: 329–335, 1982.

[40280] Further studies establishing the function and utilities of AK2 are found in John Hopkins OMIM database record ID 103020, and in cited publications numbered 798–801 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Calmodulin 2 (phosphorylase kinase, delta) (CALM2, Accession NM_001743) is another VGAM1113 host target gene. CALM2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CALM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of CALM2 BINDING SITE, designated SEQ ID:7480, to the nucleotide sequence of VGAM1113 RNA, herein designated VGAM RNA, also designated SEQ ID:3824.

[40281] Another function of VGAM1113 is therefore inhibition of Calmodulin 2 (phosphorylase kinase, delta) (CALM2, Accession NM_001743), a gene which mediates the control of a large number of enzymes by Ca^{++} . Accordingly, utilities of VGAM1113 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CALM2. The function of CALM2 has been established by previous studies. McPherson et al. (1991) tentatively assigned the CALM2 gene to chromosome 10 by study of somatic cell hybrids. However, by PCR-based amplification of CALM2-specific sequences using DNA from human/hamster cell hybrids as template, Berchtold et al. (1993) found that the CALM2 gene is located on chromosome 2. They regionalized the gene to 2p21.3-p21.1 by in situ hybridization.

[40282] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[40283] Berchtold, M. W.; Egli, R.; Rhyner, J. A.; Hameister, H.; Strehler, E. E. : Localization of the human bona fide calmodulin genes CALM1, CALM2, and CALM3 to chromosomes 14q24–q31, 2p21.1–p21.3, and 19q13.2–q13.3. Genomics 16: 461–465, 1993. ; and

[40284] McPherson, J. D.; Hickie, R. A.; Wasmuth, J. J.; Meyskens, F. L.; Perham, R. N.; Strehler, E. E.; Graham, M. T. : Chromosomal localization of multiple genes encoding calmodulin. (Abstra.

[40285] Further studies establishing the function and utilities of CALM2 are found in John Hopkins OMIM database record ID 114182, and in cited publications numbered 1257 and 12578 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Hyaluronan-mediated Motility Receptor (RHAMM) (HMMR, Accession NM_012485) is another VGAM1113 host target gene. HMMR BINDING SITE1 and HMMR BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by HMMR, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HMMR BINDING SITE1 and HMMR BINDING SITE2, desig-

nated SEQ ID:14862 and SEQ ID:14860 respectively, to the nucleotide sequence of VGAM1113 RNA, herein designated VGAM RNA, also designated SEQ ID:3824.

[40286] Another function of VGAM1113 is therefore inhibition of Hyaluronan-mediated Motility Receptor (RHAMM) (HMMR, Accession NM_012485). Accordingly, utilities of VGAM1113 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HMMR. Myotubularin Related Protein 8 (MTMR8, Accession NM_015458) is another VGAM1113 host target gene. MTMR8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MTMR8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MTMR8 BINDING SITE, designated SEQ ID:17741, to the nucleotide sequence of VGAM1113 RNA, herein designated VGAM RNA, also designated SEQ ID:3824.

[40287] Another function of VGAM1113 is therefore inhibition of Myotubularin Related Protein 8 (MTMR8, Accession NM_015458), a gene which could be a tyrosine-phosphatase. Accordingly, utilities of VGAM1113 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with MTMR8. The function of MTMR8 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM379. Pentaxin-related Gene, Rapidly Induced By IL-1 Beta (PTX3, Accession NM_002852) is another VGAM1113 host target gene. PTX3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PTX3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTX3 BINDING SITE, designated SEQ ID:8747, to the nucleotide sequence of VGAM1113 RNA, herein designated VGAM RNA, also designated SEQ ID:3824.

[40288] Another function of VGAM1113 is therefore inhibition of Pentaxin-related Gene, Rapidly Induced By IL-1 Beta (PTX3, Accession NM_002852), a gene which is similar to the pentaxin subclass of inflammatory acute-phase proteins. Accordingly, utilities of VGAM1113 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTX3. The function of PTX3 and its

association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM779. Chemokine (C-C motif) Receptor 7 (CCR7, Accession NM_001838) is another VGAM1113 host target gene. CCR7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CCR7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CCR7 BINDING SITE, designated SEQ ID:7576, to the nucleotide sequence of VGAM1113 RNA, herein designated VGAM RNA, also designated SEQ ID:3824.

[40289] Another function of VGAM1113 is therefore inhibition of Chemokine (C-C motif) Receptor 7 (CCR7, Accession NM_001838). Accordingly, utilities of VGAM1113 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CCR7. CCR4-NOT Transcription Complex, Subunit 7 (CNOT7, Accession NM_013354) is another VGAM1113 host target gene. CNOT7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CNOT7, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CNOT7 BINDING SITE, designated SEQ ID:14998, to the nucleotide sequence of VGAM1113 RNA, herein designated VGAM RNA, also designated SEQ ID:3824.

[40290] Another function of VGAM1113 is therefore inhibition of CCR4–NOT Transcription Complex, Subunit 7 (CNOT7, Accession NM_013354). Accordingly, utilities of VGAM1113 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CNOT7. FLJ12363 (Accession NM_032167) is another VGAM1113 host target gene. FLJ12363 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ12363, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12363 BINDING SITE, designated SEQ ID:25868, to the nucleotide sequence of VGAM1113 RNA, herein designated VGAM RNA, also designated SEQ ID:3824.

[40291] Another function of VGAM1113 is therefore inhibition of FLJ12363 (Accession NM_032167). Accordingly, utilities of

VGAM1113 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12363. FLJ13912 (Accession NM_022770) is another VGAM1113 host target gene. FLJ13912 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ13912, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13912 BINDING SITE, designated SEQ ID:23025, to the nucleotide sequence of VGAM1113 RNA, herein designated VGAM RNA, also designated SEQ ID:3824.

[40292] Another function of VGAM1113 is therefore inhibition of FLJ13912 (Accession NM_022770). Accordingly, utilities of VGAM1113 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13912. FLJ20340 (Accession NM_017773) is another VGAM1113 host target gene. FLJ20340 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20340, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20340

BINDING SITE, designated SEQ ID:19396, to the nucleotide sequence of VGAM1113 RNA, herein designated VGAM RNA, also designated SEQ ID:3824.

[40293] Another function of VGAM1113 is therefore inhibition of FLJ20340 (Accession NM_017773). Accordingly, utilities of VGAM1113 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20340. FLJ21240 (Accession NM_024847) is another VGAM1113 host target gene. FLJ21240 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21240, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21240 BINDING SITE, designated SEQ ID:24279, to the nucleotide sequence of VGAM1113 RNA, herein designated VGAM RNA, also designated SEQ ID:3824.

[40294] Another function of VGAM1113 is therefore inhibition of FLJ21240 (Accession NM_024847). Accordingly, utilities of VGAM1113 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21240. FLJ23022 (Accession NM_025051) is another VGAM1113 host target gene. FLJ23022 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ23022, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23022 BINDING SITE, designated SEQ ID:24647, to the nucleotide sequence of VGAM1113 RNA, herein designated VGAM RNA, also designated SEQ ID:3824.

[40295] Another function of VGAM1113 is therefore inhibition of FLJ23022 (Accession NM_025051). Accordingly, utilities of VGAM1113 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23022. KIAA0748 (Accession NM_014796) is another VGAM1113 host target gene. KIAA0748 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0748, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0748 BINDING SITE, designated SEQ ID:16698, to the nucleotide sequence of VGAM1113 RNA, herein designated VGAM RNA, also designated SEQ ID:3824.

[40296] Another function of VGAM1113 is therefore inhibition of

KIAA0748 (Accession NM_014796). Accordingly, utilities of VGAM1113 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0748. MCM10 Minichromosome Maintenance Deficient 10 (*S. cerevisiae*) (MCM10, Accession NM_018518) is another VGAM1113 host target gene. MCM10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MCM10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MCM10 BINDING SITE, designated SEQ ID:20594, to the nucleotide sequence of VGAM1113 RNA, herein designated VGAM RNA, also designated SEQ ID:3824.

[40297] Another function of VGAM1113 is therefore inhibition of MCM10 Minichromosome Maintenance Deficient 10 (*S. cerevisiae*) (MCM10, Accession NM_018518). Accordingly, utilities of VGAM1113 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MCM10. MGC15438 (Accession NM_032874) is another VGAM1113 host target gene. MGC15438 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC15438, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC15438 BINDING SITE, designated SEQ ID:26693, to the nucleotide sequence of VGAM1113 RNA, herein designated VGAM RNA, also designated SEQ ID:3824.

[40298] Another function of VGAM1113 is therefore inhibition of MGC15438 (Accession NM_032874). Accordingly, utilities of VGAM1113 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC15438. MGC22014 (Accession XM_035307) is another VGAM1113 host target gene. MGC22014 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC22014, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC22014 BINDING SITE, designated SEQ ID:32213, to the nucleotide sequence of VGAM1113 RNA, herein designated VGAM RNA, also designated SEQ ID:3824.

[40299] Another function of VGAM1113 is therefore inhibition of MGC22014 (Accession XM_035307). Accordingly, utilities of VGAM1113 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with MGC22014. Phorbol-12-myristate-13-acetate-induced Protein 1 (PMAIP1, Accession NM_021127) is another VGAM1113 host target gene. PMAIP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PMAIP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PMAIP1 BINDING SITE, designated SEQ ID:22098, to the nucleotide sequence of VGAM1113 RNA, herein designated VGAM RNA, also designated SEQ ID:3824.

[40300] Another function of VGAM1113 is therefore inhibition of Phorbol-12-myristate-13-acetate-induced Protein 1 (PMAIP1, Accession NM_021127). Accordingly, utilities of VGAM1113 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PMAIP1. Signal Sequence Receptor, Gamma (translocon-associated protein gamma) (SSR3, Accession NM_007107) is another VGAM1113 host target gene. SSR3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SSR3, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SSR3 BINDING SITE, designated SEQ ID:13971, to the nucleotide sequence of VGAM1113 RNA, herein designated VGAM RNA, also designated SEQ ID:3824.

[40301] Another function of VGAM1113 is therefore inhibition of Signal Sequence Receptor, Gamma (translocon-associated protein gamma) (SSR3, Accession NM_007107). Accordingly, utilities of VGAM1113 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SSR3. T-box 21 (TBX21, Accession NM_013351) is another VGAM1113 host target gene. TBX21 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TBX21, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TBX21 BINDING SITE, designated SEQ ID:14996, to the nucleotide sequence of VGAM1113 RNA, herein designated VGAM RNA, also designated SEQ ID:3824.

[40302] Another function of VGAM1113 is therefore inhibition of T-box 21 (TBX21, Accession NM_013351). Accordingly, utilities of VGAM1113 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with TBX21. LOC58489 (Accession XM_051862) is another VGAM1113 host target gene. LOC58489 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC58489, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC58489 BINDING SITE, designated SEQ ID:35902, to the nucleotide sequence of VGAM1113 RNA, herein designated VGAM RNA, also designated SEQ ID:3824.

[40303] Another function of VGAM1113 is therefore inhibition of LOC58489 (Accession XM_051862). Accordingly, utilities of VGAM1113 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC58489. LOC92267 (Accession XM_043979) is another VGAM1113 host target gene. LOC92267 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC92267, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92267 BINDING SITE, designated SEQ ID:34055, to the

nucleotide sequence of VGAM1113 RNA, herein designated VGAM RNA, also designated SEQ ID:3824.

[40304] Another function of VGAM1113 is therefore inhibition of LOC92267 (Accession XM_043979). Accordingly, utilities of VGAM1113 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92267. LOC92482 (Accession XM_045310) is another VGAM1113 host target gene. LOC92482 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC92482, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92482 BINDING SITE, designated SEQ ID:34432, to the nucleotide sequence of VGAM1113 RNA, herein designated VGAM RNA, also designated SEQ ID:3824.

[40305] Another function of VGAM1113 is therefore inhibition of LOC92482 (Accession XM_045310). Accordingly, utilities of VGAM1113 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92482. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Ad-

dress Messenger 1114 (VGAM1114) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[40306] VGAM1114 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1114 was detected is described hereinabove with reference to Figs. 1-8.

[40307] VGAM1114 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox Virus. VGAM1114 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[40308] VGAM1114 gene encodes a VGAM1114 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1114 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1114 precursor RNA is designated SEQ ID:1100, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1100 is located at position 101465 relative to the genome of Camelpox Virus.

[40309] VGAM1114 precursor RNA folds onto itself, forming VGAM1114 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[40310] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1114 folded precursor RNA into VGAM1114 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 58%) nucleotide sequence of VGAM1114 RNA is designated SEQ ID:3825, and is provided hereinbelow with reference to the sequence listing part.

[40311] VGAM1114 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1114 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM1114 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[40312] VGAM1114 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1114 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1114 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1114 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1114 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[40313] The complementary binding of VGAM1114 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1114 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1114 host target RNA into VGAM1114 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[40314] It is appreciated that VGAM1114 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1114 host target genes. The mRNA of each one of this plurality of VGAM1114 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1114 RNA, herein designated VGAM RNA, and which when bound by VGAM1114 RNA causes inhibition of translation of respective one or more VGAM1114 host target proteins.

[40315] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1114 gene, herein designated VGAM GENE, on one or more VGAM1114 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[40316] It is yet further appreciated that a function of VGAM1114 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1114 include diagnosis, prevention and treatment of viral infection by Camelpox Virus. Specific functions, and accordingly utilities, of VGAM1114 correlate with, and may be deduced from, the identity of the

host target genes which VGAM1114 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[40317] Nucleotide sequences of the VGAM1114 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1114 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1114 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1114 are further described hereinbelow with reference to Table 1.

[40318] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1114 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1114 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[40319] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1114 gene, herein designated VGAM is inhibition of expression of VGAM1114 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1114 correlate with, and may be deduced from, the identity of the target genes which VGAM1114

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[40320] G Protein-coupled Receptor Kinase 7 (GPRK7, Accession NM_139209) is a VGAM1114 host target gene. GPRK7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GPRK7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GPRK7 BINDING SITE, designated SEQ ID:29226, to the nucleotide sequence of VGAM1114 RNA, herein designated VGAM RNA, also designated SEQ ID:3825.

[40321] A function of VGAM1114 is therefore inhibition of G Protein-coupled Receptor Kinase 7 (GPRK7, Accession NM_139209), a gene which may play a role in signal transduction pathways that involve calcium as a second messenger. Accordingly, utilities of VGAM1114 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPRK7. The function of GPRK7 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM640.Solute Carrier Family 12 (potassium/chloride

transporters), Member 7 (SLC12A7, Accession NM_006598) is another VGAM1114 host target gene. SLC12A7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC12A7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC12A7 BINDING SITE, designated SEQ ID:13372, to the nucleotide sequence of VGAM1114 RNA, herein designated VGAM RNA, also designated SEQ ID:3825.

[40322] Another function of VGAM1114 is therefore inhibition of Solute Carrier Family 12 (potassium/chloride transporters), Member 7 (SLC12A7, Accession NM_006598), a gene which is a potassium/chloride-cotransporter. Accordingly, utilities of VGAM1114 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC12A7. The function of SLC12A7 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM200. Solute Carrier Family 4, Sodium Bicarbonate Cotransporter, Member 7 (SLC4A7, Accession NM_003615) is another VGAM1114

host target gene. SLC4A7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC4A7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC4A7 BINDING SITE, designated SEQ ID:9667, to the nucleotide sequence of VGAM1114 RNA, herein designated VGAM RNA, also designated SEQ ID:3825.

[40323] Another function of VGAM1114 is therefore inhibition of Solute Carrier Family 4, Sodium Bicarbonate Cotransporter, Member 7 (SLC4A7, Accession NM_003615), a gene which mediates the coupled movement of sodium and bicarbonate ions across the plasma membrane. Accordingly, utilities of VGAM1114 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC4A7. The function of SLC4A7 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM66.KIAA0391 (Accession NM_014672) is another VGAM1114 host target gene. KIAA0391 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded

by KIAA0391, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0391 BINDING SITE, designated SEQ ID:16134, to the nucleotide sequence of VGAM1114 RNA, herein designated VGAM RNA, also designated SEQ ID:3825.

[40324] Another function of VGAM1114 is therefore inhibition of KIAA0391 (Accession NM_014672). Accordingly, utilities of VGAM1114 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0391. KIAA1884 (Accession XM_055539) is another VGAM1114 host target gene. KIAA1884 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1884, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1884 BINDING SITE, designated SEQ ID:36289, to the nucleotide sequence of VGAM1114 RNA, herein designated VGAM RNA, also designated SEQ ID:3825.

[40325] Another function of VGAM1114 is therefore inhibition of KIAA1884 (Accession XM_055539). Accordingly, utilities

of VGAM1114 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1884. PP1201 (Accession NM_022152) is another VGAM1114 host target gene. PP1201 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PP1201, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PP1201 BINDING SITE, designated SEQ ID:22709, to the nucleotide sequence of VGAM1114 RNA, herein designated VGAM RNA, also designated SEQ ID:3825.

[40326] Another function of VGAM1114 is therefore inhibition of PP1201 (Accession NM_022152). Accordingly, utilities of VGAM1114 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PP1201. PRO0659 (Accession NM_014138) is another VGAM1114 host target gene. PRO0659 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRO0659, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO0659

BINDING SITE, designated SEQ ID:15404, to the nucleotide sequence of VGAM1114 RNA, herein designated VGAM RNA, also designated SEQ ID:3825.

[40327] Another function of VGAM1114 is therefore inhibition of PRO0659 (Accession NM_014138). Accordingly, utilities of VGAM1114 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO0659. LOC148824 (Accession XM_097527) is another VGAM1114 host target gene. LOC148824 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC148824, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148824 BINDING SITE, designated SEQ ID:40905, to the nucleotide sequence of VGAM1114 RNA, herein designated VGAM RNA, also designated SEQ ID:3825.

[40328] Another function of VGAM1114 is therefore inhibition of LOC148824 (Accession XM_097527). Accordingly, utilities of VGAM1114 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148824. LOC203286 (Accession XM_117526) is another VGAM1114 host target gene. LOC203286 BINDING

SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC203286, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203286 BINDING SITE, designated SEQ ID:43492, to the nucleotide sequence of VGAM1114 RNA, herein designated VGAM RNA, also designated SEQ ID:3825.

[40329] Another function of VGAM1114 is therefore inhibition of LOC203286 (Accession XM_117526). Accordingly, utilities of VGAM1114 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203286. LOC221543 (Accession XM_168091) is another VGAM1114 host target gene. LOC221543 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221543, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221543 BINDING SITE, designated SEQ ID:45014, to the nucleotide sequence of VGAM1114 RNA, herein designated VGAM RNA, also designated SEQ ID:3825.

[40330] Another function of VGAM1114 is therefore inhibition of

LOC221543 (Accession XM_168091). Accordingly, utilities of VGAM1114 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221543. LOC257596 (Accession XM_175296) is another VGAM1114 host target gene. LOC257596 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC257596, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257596 BINDING SITE, designated SEQ ID:46754, to the nucleotide sequence of VGAM1114 RNA, herein designated VGAM RNA, also designated SEQ ID:3825.

[40331] Another function of VGAM1114 is therefore inhibition of LOC257596 (Accession XM_175296). Accordingly, utilities of VGAM1114 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257596. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1115 (VGAM1115) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes

is known in the art.

[40332] VGAM1115 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1115 was detected is described hereinabove with reference to Figs. 1–8.

[40333] VGAM1115 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox Virus. VGAM1115 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[40334] VGAM1115 gene encodes a VGAM1115 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1115 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1115 precursor RNA is designated SEQ ID:1101, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1101 is located at position 100938 relative to the genome of Camelpox Virus.

[40335] VGAM1115 precursor RNA folds onto itself, forming VGAM1115 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two–

dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[40336] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1115 folded precursor RNA into VGAM1115 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 72%) nucleotide sequence of VGAM1115 RNA is designated SEQ ID:3826, and is provided hereinbelow with reference to the sequence listing part.

[40337] VGAM1115 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1115 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1115 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein cod-

ing region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[40338] VGAM1115 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1115 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1115 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1115 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1115 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR

and 5`UTR regions.

[40339] The complementary binding of VGAM1115 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1115 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1115 host target RNA into VGAM1115 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[40340] It is appreciated that VGAM1115 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1115 host target genes. The mRNA of each one of this plurality of VGAM1115 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1115 RNA, herein designated VGAM RNA, and which when bound by VGAM1115 RNA causes inhibition of translation of respective one or more VGAM1115 host target proteins.

[40341] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1115 gene, herein designated VGAM GENE, on one

or more VGAM1115 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[40342] It is yet further appreciated that a function of VGAM1115 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1115 include diagnosis, prevention and treatment of viral infection by Camelpox Virus. Specific functions, and accordingly utilities, of VGAM1115 correlate with, and may be deduced from, the identity of the host target genes which VGAM1115 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[40343] Nucleotide sequences of the VGAM1115 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1115 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1115 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1115 are further described hereinbelow with reference to Table 1.

[40344] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1115 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1115 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[40345] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1115 gene, herein designated VGAM is inhibition of expression of VGAM1115 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1115 correlate with, and may be deduced from, the identity of the target genes which VGAM1115 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[40346] Integrin, Alpha 3 (antigen CD49C, alpha 3 subunit of VLA-

3 receptor) (ITGA3, Accession NM_002204) is a VGAM1115 host target gene. ITGA3 BINDING SITE1 and ITGA3 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ITGA3, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITGA3 BINDING SITE1 and ITGA3 BINDING SITE2, designated SEQ ID:7964 and SEQ ID:12007 respectively, to the nucleotide sequence of VGAM1115 RNA, herein designated VGAM RNA, also designated SEQ ID:3826.

[40347] A function of VGAM1115 is therefore inhibition of Integrin, Alpha 3 (antigen CD49C, alpha 3 subunit of VLA-3 receptor) (ITGA3, Accession NM_002204), a gene which is a receptor for fibronectin, laminin, collagen, epiligrin and thrombospondin. Accordingly, utilities of VGAM1115 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITGA3. The function of ITGA3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1020.BSPECV (Accession NM_016642) is another

VGAM1115 host target gene. BSPECV BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by BSPECV, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BSPECV BINDING SITE, designated SEQ ID:18748, to the nucleotide sequence of VGAM1115 RNA, herein designated VGAM RNA, also designated SEQ ID:3826.

[40348] Another function of VGAM1115 is therefore inhibition of BSPECV (Accession NM_016642). Accordingly, utilities of VGAM1115 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BSPECV. Calpain 6 (CAPN6, Accession NM_014289) is another VGAM1115 host target gene. CAPN6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CAPN6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CAPN6 BINDING SITE, designated SEQ ID:15571, to the nucleotide sequence of VGAM1115 RNA, herein designated VGAM RNA, also designated SEQ ID:3826.

[40349] Another function of VGAM1115 is therefore inhibition of Calpain 6 (CAPN6, Accession NM_014289). Accordingly, utilities of VGAM1115 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAPN6. HRD1 (Accession XM_045498) is another VGAM1115 host target gene. HRD1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HRD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HRD1 BINDING SITE, designated SEQ ID:34474, to the nucleotide sequence of VGAM1115 RNA, herein designated VGAM RNA, also designated SEQ ID:3826.

[40350] Another function of VGAM1115 is therefore inhibition of HRD1 (Accession XM_045498). Accordingly, utilities of VGAM1115 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HRD1. KIAA0293 (Accession XM_027045) is another VGAM1115 host target gene. KIAA0293 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0293, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0293 BINDING SITE, designated SEQ ID:30394, to the nucleotide sequence of VGAM1115 RNA, herein designated VGAM RNA, also designated SEQ ID:3826.

[40351] Another function of VGAM1115 is therefore inhibition of KIAA0293 (Accession XM_027045). Accordingly, utilities of VGAM1115 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0293. KIAA0712 (Accession NM_014715) is another VGAM1115 host target gene. KIAA0712 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0712, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0712 BINDING SITE, designated SEQ ID:16266, to the nucleotide sequence of VGAM1115 RNA, herein designated VGAM RNA, also designated SEQ ID:3826.

[40352] Another function of VGAM1115 is therefore inhibition of KIAA0712 (Accession NM_014715). Accordingly, utilities of VGAM1115 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA0712. KIAA0889 (Accession NM_015377) is another VGAM1115 host target gene. KIAA0889 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0889, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0889 BINDING SITE, designated SEQ ID:17675, to the nucleotide sequence of VGAM1115 RNA, herein designated VGAM RNA, also designated SEQ ID:3826.

[40353] Another function of VGAM1115 is therefore inhibition of KIAA0889 (Accession NM_015377). Accordingly, utilities of VGAM1115 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0889. KIAA1853 (Accession XM_045184) is another VGAM1115 host target gene. KIAA1853 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1853, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1853 BINDING SITE, designated SEQ ID:34384, to the nucleotide sequence of VGAM1115 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3826.

[40354] Another function of VGAM1115 is therefore inhibition of KIAA1853 (Accession XM_045184). Accordingly, utilities of VGAM1115 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1853. MGC1842 (Accession XM_037797) is another VGAM1115 host target gene. MGC1842 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC1842, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC1842 BINDING SITE, designated SEQ ID:32686, to the nucleotide sequence of VGAM1115 RNA, herein designated VGAM RNA, also designated SEQ ID:3826.

[40355] Another function of VGAM1115 is therefore inhibition of MGC1842 (Accession XM_037797). Accordingly, utilities of VGAM1115 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC1842. MGC20460 (Accession NM_053043) is another VGAM1115 host target gene. MGC20460 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC20460, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC20460 BINDING SITE, designated SEQ ID:27588, to the nucleotide sequence of VGAM1115 RNA, herein designated VGAM RNA, also designated SEQ ID:3826.

[40356] Another function of VGAM1115 is therefore inhibition of MGC20460 (Accession NM_053043). Accordingly, utilities of VGAM1115 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC20460. MIDORI (Accession XM_057651) is another VGAM1115 host target gene. MIDORI BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MIDORI, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MIDORI BINDING SITE, designated SEQ ID:36527, to the nucleotide sequence of VGAM1115 RNA, herein designated VGAM RNA, also designated SEQ ID:3826.

[40357] Another function of VGAM1115 is therefore inhibition of MIDORI (Accession XM_057651). Accordingly, utilities of VGAM1115 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with MI-DORI. PRO2533 (Accession NM_018629) is another VGAM1115 host target gene. PRO2533 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PRO2533, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO2533 BINDING SITE, designated SEQ ID:20701, to the nucleotide sequence of VGAM1115 RNA, herein designated VGAM RNA, also designated SEQ ID:3826.

[40358] Another function of VGAM1115 is therefore inhibition of PRO2533 (Accession NM_018629). Accordingly, utilities of VGAM1115 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO2533. Zinc Finger Protein 384 (ZNF384, Accession NM_133476) is another VGAM1115 host target gene. ZNF384 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZNF384, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF384 BINDING SITE, designated SEQ

ID:28546, to the nucleotide sequence of VGAM1115 RNA, herein designated VGAM RNA, also designated SEQ ID:3826.

[40359] Another function of VGAM1115 is therefore inhibition of Zinc Finger Protein 384 (ZNF384, Accession NM_133476). Accordingly, utilities of VGAM1115 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF384. LOC147976 (Accession XM_085980) is another VGAM1115 host target gene. LOC147976 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC147976, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147976 BINDING SITE, designated SEQ ID:38428, to the nucleotide sequence of VGAM1115 RNA, herein designated VGAM RNA, also designated SEQ ID:3826.

[40360] Another function of VGAM1115 is therefore inhibition of LOC147976 (Accession XM_085980). Accordingly, utilities of VGAM1115 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147976. LOC153565 (Accession XM_087713) is an-

other VGAM1115 host target gene. LOC153565 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC153565, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153565 BINDING SITE, designated SEQ ID:39402, to the nucleotide sequence of VGAM1115 RNA, herein designated VGAM RNA, also designated SEQ ID:3826.

[40361] Another function of VGAM1115 is therefore inhibition of LOC153565 (Accession XM_087713). Accordingly, utilities of VGAM1115 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153565. LOC202908 (Accession XM_114602) is another VGAM1115 host target gene. LOC202908 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC202908, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC202908 BINDING SITE, designated SEQ ID:42995, to the nucleotide sequence of VGAM1115 RNA, herein designated VGAM RNA, also designated SEQ ID:3826.

[40362] Another function of VGAM1115 is therefore inhibition of LOC202908 (Accession XM_114602). Accordingly, utilities of VGAM1115 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC202908. LOC222057 (Accession XM_166594) is another VGAM1115 host target gene. LOC222057 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC222057, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222057 BINDING SITE, designated SEQ ID:44571, to the nucleotide sequence of VGAM1115 RNA, herein designated VGAM RNA, also designated SEQ ID:3826.

[40363] Another function of VGAM1115 is therefore inhibition of LOC222057 (Accession XM_166594). Accordingly, utilities of VGAM1115 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222057. LOC255975 (Accession XM_171083) is another VGAM1115 host target gene. LOC255975 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC255975, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255975 BINDING SITE, designated SEQ ID:45888, to the nucleotide sequence of VGAM1115 RNA, herein designated VGAM RNA, also designated SEQ ID:3826.

[40364] Another function of VGAM1115 is therefore inhibition of LOC255975 (Accession XM_171083). Accordingly, utilities of VGAM1115 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255975. LOC256878 (Accession XM_173042) is another VGAM1115 host target gene. LOC256878 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC256878, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256878 BINDING SITE, designated SEQ ID:46306, to the nucleotide sequence of VGAM1115 RNA, herein designated VGAM RNA, also designated SEQ ID:3826.

[40365] Another function of VGAM1115 is therefore inhibition of LOC256878 (Accession XM_173042). Accordingly, utilities of VGAM1115 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC256878. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1116 (VGAM1116) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[40366] VGAM1116 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1116 was detected is described hereinabove with reference to Figs. 1–8.

[40367] VGAM1116 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Monkeypox Virus. VGAM1116 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[40368] VGAM1116 gene encodes a VGAM1116 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1116 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1116 precursor RNA is designated SEQ ID:1102, and is provided hereinbelow with ref–

erence to the sequence listing part. Nucleotide sequence SEQ ID:1102 is located at position 49513 relative to the genome of Monkeypox Virus.

[40369] VGAM1116 precursor RNA folds onto itself, forming VGAM1116 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[40370] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1116 folded precursor RNA into VGAM1116 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 63%) nucleotide sequence of VGAM1116 RNA is designated SEQ ID:3827, and is provided hereinbelow with reference to the sequence listing part.

[40371] VGAM1116 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1116 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1116 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[40372] VGAM1116 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1116 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1116 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1116 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM1116 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[40373] The complementary binding of VGAM1116 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1116 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1116 host target RNA into VGAM1116 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[40374] It is appreciated that VGAM1116 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1116 host target genes. The mRNA of each one of this plurality of VGAM1116 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1116 RNA, herein designated VGAM RNA, and which when bound by VGAM1116 RNA causes

inhibition of translation of respective one or more VGAM1116 host target proteins.

[40375] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1116 gene, herein designated VGAM GENE, on one or more VGAM1116 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[40376] It is yet further appreciated that a function of VGAM1116 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1116 include diagnosis, prevention and

treatment of viral infection by Monkeypox Virus. Specific functions, and accordingly utilities, of VGAM1116 correlate with, and may be deduced from, the identity of the host target genes which VGAM1116 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[40377] Nucleotide sequences of the VGAM1116 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1116 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1116 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1116 are further described hereinbelow with reference to Table 1.

[40378] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1116 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1116 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[40379] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1116 gene, herein designated VGAM is inhibition of expression of VGAM1116 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM1116 correlate with, and may be deduced from, the identity of the target genes which VGAM1116 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[40380] HBP1 (Accession NM_012257) is a VGAM1116 host target gene. HBP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HBP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HBP1 BINDING SITE, designated SEQ ID:14564, to the nucleotide sequence of VGAM1116 RNA, herein designated VGAM RNA, also designated SEQ ID:3827.

[40381] A function of VGAM1116 is therefore inhibition of HBP1 (Accession NM_012257). Accordingly, utilities of VGAM1116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HBP1. PSR (Accession XM_036784) is another VGAM1116 host target gene. PSR BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PSR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of PSR BINDING SITE, designated SEQ ID:32500, to the nucleotide sequence of VGAM1116 RNA, herein designated VGAM RNA, also designated SEQ ID:3827.

[40382] Another function of VGAM1116 is therefore inhibition of PSR (Accession XM_036784). Accordingly, utilities of VGAM1116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PSR. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1117 (VGAM1117) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[40383] VGAM1117 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1117 was detected is described hereinabove with reference to Figs. 1–8.

[40384] VGAM1117 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Monkeypox Virus. VGAM1117 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[40385] VGAM1117 gene encodes a VGAM1117 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1117 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1117 precursor RNA is designated SEQ ID:1103, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1103 is located at position 45352 relative to the genome of Monkeypox Virus.

[40386] VGAM1117 precursor RNA folds onto itself, forming VGAM1117 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[40387] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1117 folded precursor RNA into VGAM1117 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 65%) nucleotide sequence of VGAM1117 RNA is designated SEQ ID:3828, and is provided hereinbelow with reference to the sequence listing part.

[40388] VGAM1117 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1117 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1117 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[40389] VGAM1117 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1117 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1117 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1117 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1117 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[40390] The complementary binding of VGAM1117 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1117 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1117 host target RNA into VGAM1117 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[40391] It is appreciated that VGAM1117 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1117 host target genes. The mRNA of each one of this plurality of VGAM1117 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1117 RNA, herein designated VGAM RNA, and which when bound by VGAM1117 RNA causes inhibition of translation of respective one or more VGAM1117 host target proteins.

[40392] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1117 gene, herein designated VGAM GENE, on one or more VGAM1117 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G.,
`Perspective: Glimpses of a tiny RNA world`, Science
294,779 (2001)).

[40393] It is yet further appreciated that a function of VGAM1117 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1117 include diagnosis, prevention and treatment of viral infection by Monkeypox Virus. Specific functions, and accordingly utilities, of VGAM1117 correlate with, and may be deduced from, the identity of the host target genes which VGAM1117 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[40394] Nucleotide sequences of the VGAM1117 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1117 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1117 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1117 are further described hereinbelow with reference to Table 1.

[40395] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1117 host target RNA, and

schematic representation of the complementarity of each of these host target binding sites to VGAM1117 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[40396] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1117 gene, herein designated VGAM is inhibition of expression of VGAM1117 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1117 correlate with, and may be deduced from, the identity of the target genes which VGAM1117 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[40397] KIAA1841 (Accession XM_087056) is a VGAM1117 host target gene. KIAA1841 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1841, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1841 BINDING SITE, designated SEQ ID:39025, to the nucleotide sequence of VGAM1117 RNA, herein designated VGAM RNA, also designated SEQ ID:3828.

[40398] A function of VGAM1117 is therefore inhibition of

KIAA1841 (Accession XM_087056). Accordingly, utilities of VGAM1117 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1841. LOC150468 (Accession XM_086926) is another VGAM1117 host target gene. LOC150468 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150468, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150468 BINDING SITE, designated SEQ ID:38974, to the nucleotide sequence of VGAM1117 RNA, herein designated VGAM RNA, also designated SEQ ID:3828.

[40399] Another function of VGAM1117 is therefore inhibition of LOC150468 (Accession XM_086926). Accordingly, utilities of VGAM1117 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150468. LOC54557 (Accession XM_052961) is another VGAM1117 host target gene. LOC54557 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC54557, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of LOC54557 BINDING SITE, designated SEQ ID:36054, to the nucleotide sequence of VGAM1117 RNA, herein designated VGAM RNA, also designated SEQ ID:3828.

[40400] Another function of VGAM1117 is therefore inhibition of LOC54557 (Accession XM_052961). Accordingly, utilities of VGAM1117 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC54557. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1118 (VGAM1118) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[40401] VGAM1118 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1118 was detected is described hereinabove with reference to Figs. 1–8.

[40402] VGAM1118 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Monkeypox Virus. VGAM1118 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[40403] VGAM1118 gene encodes a VGAM1118 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1118 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1118 precursor RNA is designated SEQ ID:1104, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1104 is located at position 45554 relative to the genome of Monkeypox Virus.

[40404] VGAM1118 precursor RNA folds onto itself, forming VGAM1118 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[40405] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1118 folded precursor RNA into VGAM1118 RNA, herein designated VGAM RNA, a single stranded ~22

nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1118 RNA is designated SEQ ID:3829, and is provided hereinbelow with reference to the sequence listing part.

[40406] VGAM1118 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1118 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1118 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[40407] VGAM1118 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1118 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1118 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1118 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1118 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[40408] The complementary binding of VGAM1118 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1118 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1118 host target RNA into VGAM1118 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[40409] It is appreciated that VGAM1118 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1118 host target genes. The mRNA of each one of this plurality of VGAM1118 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1118 RNA, herein designated VGAM RNA, and which when bound by VGAM1118 RNA causes inhibition of translation of respective one or more VGAM1118 host target proteins.

[40410] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1118 gene, herein designated VGAM GENE, on one or more VGAM1118 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[40411] It is yet further appreciated that a function of VGAM1118 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1118 include diagnosis, prevention and treatment of viral infection by Monkeypox Virus. Specific functions, and accordingly utilities, of VGAM1118 correlate with, and may be deduced from, the identity of the host target genes which VGAM1118 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[40412] Nucleotide sequences of the VGAM1118 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1118 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1118 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1118 are further described hereinbelow with reference to Table 1.

[40413] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM1118 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1118 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[40414] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1118 gene, herein designated VGAM is inhibition of expression of VGAM1118 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1118 correlate with, and may be deduced from, the identity of the target genes which VGAM1118 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[40415] Sulfotransferase Family, Cytosolic, 1C, Member 1 (SULT1C1, Accession NM_001056) is a VGAM1118 host target gene. SULT1C1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SULT1C1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SULT1C1 BINDING SITE, designated SEQ ID:6718, to the nucleotide sequence of VGAM1118 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:3829.

[40416] A function of VGAM1118 is therefore inhibition of Sulfo-transferase Family, Cytosolic, 1C, Member 1 (SULT1C1, Accession NM_001056). Accordingly, utilities of VGAM1118 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SULT1C1. Chromosome X Open Reading Frame 1 (CXorf1, Accession NM_004709) is another VGAM1118 host target gene. CXorf1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CXorf1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CXorf1 BINDING SITE, designated SEQ ID:11052, to the nucleotide sequence of VGAM1118 RNA, herein designated VGAM RNA, also designated SEQ ID:3829.

[40417] Another function of VGAM1118 is therefore inhibition of Chromosome X Open Reading Frame 1 (CXorf1, Accession NM_004709). Accordingly, utilities of VGAM1118 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CXorf1. KIAA1211 (Accession XM_044178) is another VGAM1118 host target

gene. KIAA1211 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1211, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1211 BINDING SITE, designated SEQ ID:34164, to the nucleotide sequence of VGAM1118 RNA, herein designated VGAM RNA, also designated SEQ ID:3829.

[40418] Another function of VGAM1118 is therefore inhibition of KIAA1211 (Accession XM_044178). Accordingly, utilities of VGAM1118 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1211. SH3 Domain Binding Glutamic Acid-rich Protein Like (SH3BGRL, Accession XM_030373) is another VGAM1118 host target gene. SH3BGRL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SH3BGRL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SH3BGRL BINDING SITE, designated SEQ ID:31022, to the nucleotide sequence of VGAM1118 RNA, herein designated VGAM

RNA, also designated SEQ ID:3829.

[40419] Another function of VGAM1118 is therefore inhibition of SH3 Domain Binding Glutamic Acid-rich Protein Like (SH3BGRL, Accession XM_030373). Accordingly, utilities of VGAM1118 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SH3BGRL. LOC221143 (Accession XM_167986) is another VGAM1118 host target gene. LOC221143 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221143, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221143 BINDING SITE, designated SEQ ID:44940, to the nucleotide sequence of VGAM1118 RNA, herein designated VGAM RNA, also designated SEQ ID:3829.

[40420] Another function of VGAM1118 is therefore inhibition of LOC221143 (Accession XM_167986). Accordingly, utilities of VGAM1118 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221143. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Ad-

dress Messenger 1119 (VGAM1119) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[40421] VGAM1119 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1119 was detected is described hereinabove with reference to Figs. 1–8.

[40422] VGAM1119 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox Virus. VGAM1119 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[40423] VGAM1119 gene encodes a VGAM1119 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1119 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1119 precursor RNA is designated SEQ ID:1105, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1105 is located at position 49470 relative to the genome of Camelpox Virus.

[40424] VGAM1119 precursor RNA folds onto itself, forming VGAM1119 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[40425] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1119 folded precursor RNA into VGAM1119 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM1119 RNA is designated SEQ ID:3830, and is provided hereinbelow with reference to the sequence listing part.

[40426] VGAM1119 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1119 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM1119 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[40427] VGAM1119 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1119 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1119 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1119 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1119 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[40428] The complementary binding of VGAM1119 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1119 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1119 host target RNA into VGAM1119 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[40429] It is appreciated that VGAM1119 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1119 host target genes. The mRNA of each one of this plurality of VGAM1119 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1119 RNA, herein designated VGAM RNA, and which when bound by VGAM1119 RNA causes inhibition of translation of respective one or more VGAM1119 host target proteins.

[40430] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1119 gene, herein designated VGAM GENE, on one or more VGAM1119 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[40431] It is yet further appreciated that a function of VGAM1119 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1119 include diagnosis, prevention and treatment of viral infection by Camelpox Virus. Specific functions, and accordingly utilities, of VGAM1119 correlate with, and may be deduced from, the identity of the

host target genes which VGAM1119 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[40432] Nucleotide sequences of the VGAM1119 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1119 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1119 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1119 are further described hereinbelow with reference to Table 1.

[40433] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1119 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1119 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[40434] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1119 gene, herein designated VGAM is inhibition of expression of VGAM1119 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1119 correlate with, and may be deduced from, the identity of the target genes which VGAM1119

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[40435] Collagen, Type VI, Alpha 1 (COL6A1, Accession NM_001848) is a VGAM1119 host target gene. COL6A1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by COL6A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COL6A1 BINDING SITE, designated SEQ ID:7583, to the nucleotide sequence of VGAM1119 RNA, herein designated VGAM RNA, also designated SEQ ID:3830.

[40436] A function of VGAM1119 is therefore inhibition of Collagen, Type VI, Alpha 1 (COL6A1, Accession NM_001848). Accordingly, utilities of VGAM1119 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COL6A1. Interleukin 15 Receptor, Alpha (IL15RA, Accession NM_002189) is another VGAM1119 host target gene. IL15RA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IL15RA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL15RA BINDING SITE, designated SEQ ID:7945, to the nucleotide sequence of VGAM1119 RNA, herein designated VGAM RNA, also designated SEQ ID:3830.

[40437] Another function of VGAM1119 is therefore inhibition of Interleukin 15 Receptor, Alpha (IL15RA, Accession NM_002189), a gene which is essential for signal transduction. Accordingly, utilities of VGAM1119 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL15RA. The function of IL15RA and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1103. Calcium/calmodulin-dependent Protein Kinase Kinase 1, Alpha (CAMKK1, Accession NM_032294) is another VGAM1119 host target gene. CAMKK1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CAMKK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CAMKK1 BINDING SITE, designated SEQ ID:26062, to the nucleotide

sequence of VGAM1119 RNA, herein designated VGAM RNA, also designated SEQ ID:3830.

[40438] Another function of VGAM1119 is therefore inhibition of Calcium/calmodulin-dependent Protein Kinase Kinase 1, Alpha (CAMKK1, Accession NM_032294). Accordingly, utilities of VGAM1119 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAMKK1. KIAA1399 (Accession XM_046685) is another VGAM1119 host target gene. KIAA1399 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1399, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1399 BINDING SITE, designated SEQ ID:34795, to the nucleotide sequence of VGAM1119 RNA, herein designated VGAM RNA, also designated SEQ ID:3830.

[40439] Another function of VGAM1119 is therefore inhibition of KIAA1399 (Accession XM_046685). Accordingly, utilities of VGAM1119 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1399. LOC153937 (Accession XM_087813) is another VGAM1119 host target gene. LOC153937 BINDING SITE is

HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC153937, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153937 BINDING SITE, designated SEQ ID:39442, to the nucleotide sequence of VGAM1119 RNA, herein designated VGAM RNA, also designated SEQ ID:3830.

[40440] Another function of VGAM1119 is therefore inhibition of LOC153937 (Accession XM_087813). Accordingly, utilities of VGAM1119 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153937. LOC222234 (Accession XM_168558) is another VGAM1119 host target gene. LOC222234 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC222234, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222234 BINDING SITE, designated SEQ ID:45238, to the nucleotide sequence of VGAM1119 RNA, herein designated VGAM RNA, also designated SEQ ID:3830.

[40441] Another function of VGAM1119 is therefore inhibition of

LOC222234 (Accession XM_168558). Accordingly, utilities of VGAM1119 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222234. LOC255565 (Accession XM_170811) is another VGAM1119 host target gene. LOC255565 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC255565, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255565 BINDING SITE, designated SEQ ID:45586, to the nucleotide sequence of VGAM1119 RNA, herein designated VGAM RNA, also designated SEQ ID:3830.

[40442] Another function of VGAM1119 is therefore inhibition of LOC255565 (Accession XM_170811). Accordingly, utilities of VGAM1119 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255565. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1120 (VGAM1120) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes

is known in the art.

[40443] VGAM1120 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1120 was detected is described hereinabove with reference to Figs. 1–8.

[40444] VGAM1120 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Monkeypox Virus. VGAM1120 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[40445] VGAM1120 gene encodes a VGAM1120 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1120 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1120 precursor RNA is designated SEQ ID:1106, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1106 is located at position 44913 relative to the genome of Monkeypox Virus.

[40446] VGAM1120 precursor RNA folds onto itself, forming VGAM1120 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two–

dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[40447] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1120 folded precursor RNA into VGAM1120 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1120 RNA is designated SEQ ID:3831, and is provided hereinbelow with reference to the sequence listing part.

[40448] VGAM1120 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1120 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1120 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein cod-

ing region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[40449] VGAM1120 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1120 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1120 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1120 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1120 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR

and 5`UTR regions.

[40450] The complementary binding of VGAM1120 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1120 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1120 host target RNA into VGAM1120 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[40451] It is appreciated that VGAM1120 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1120 host target genes. The mRNA of each one of this plurality of VGAM1120 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1120 RNA, herein designated VGAM RNA, and which when bound by VGAM1120 RNA causes inhibition of translation of respective one or more VGAM1120 host target proteins.

[40452] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1120 gene, herein designated VGAM GENE, on one

or more VGAM1120 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[40453] It is yet further appreciated that a function of VGAM1120 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1120 include diagnosis, prevention and treatment of viral infection by Monkeypox Virus. Specific functions, and accordingly utilities, of VGAM1120 correlate with, and may be deduced from, the identity of the host target genes which VGAM1120 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[40454] Nucleotide sequences of the VGAM1120 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1120 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1120 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1120 are further described hereinbelow with reference to Table 1.

[40455] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1120 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1120 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[40456] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1120 gene, herein designated VGAM is inhibition of expression of VGAM1120 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1120 correlate with, and may be deduced from, the identity of the target genes which VGAM1120 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[40457] Fibroblast Growth Factor 5 (FGF5, Accession NM_004464)

is a VGAM1120 host target gene. FGF5 BINDING SITE1 and FGF5 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FGF5, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FGF5 BINDING SITE1 and FGF5 BINDING SITE2, designated SEQ ID:10769 and SEQ ID:26996 respectively, to the nucleotide sequence of VGAM1120 RNA, herein designated VGAM RNA, also designated SEQ ID:3831.

[40458] A function of VGAM1120 is therefore inhibition of Fibroblast Growth Factor 5 (FGF5, Accession NM_004464), a gene which induces transformation and may regulate neuronal differentiation. Accordingly, utilities of VGAM1120 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FGF5. The function of FGF5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM276. Platelet-derived Growth Factor Receptor, Alpha Polypeptide (PDGFRA, Accession NM_006206) is another VGAM1120 host target gene. PDGFRA BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by PDGFRA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDGFRA BINDING SITE, designated SEQ ID:12884, to the nucleotide sequence of VGAM1120 RNA, herein designated VGAM RNA, also designated SEQ ID:3831.

[40459] Another function of VGAM1120 is therefore inhibition of Platelet-derived Growth Factor Receptor, Alpha Polypeptide (PDGFRA, Accession NM_006206), a gene which this receptor binds platelet-derived growth factor and has a tyrosine-protein kinase activity. Accordingly, utilities of VGAM1120 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDGFRA. The function of PDGFRA and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM117.FLJ10996 (Accession NM_019044) is another VGAM1120 host target gene. FLJ10996 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10996, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of FLJ10996 BINDING SITE, designated SEQ ID:21127, to the nucleotide sequence of VGAM1120 RNA, herein designated VGAM RNA, also designated SEQ ID:3831.

[40460] Another function of VGAM1120 is therefore inhibition of FLJ10996 (Accession NM_019044). Accordingly, utilities of VGAM1120 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10996. LOC146713 (Accession XM_097071) is another VGAM1120 host target gene. LOC146713 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146713, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146713 BINDING SITE, designated SEQ ID:40715, to the nucleotide sequence of VGAM1120 RNA, herein designated VGAM RNA, also designated SEQ ID:3831.

[40461] Another function of VGAM1120 is therefore inhibition of LOC146713 (Accession XM_097071). Accordingly, utilities of VGAM1120 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146713. LOC150271 (Accession XM_097859) is an-

other VGAM1120 host target gene. LOC150271 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150271, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150271 BINDING SITE, designated SEQ ID:41170, to the nucleotide sequence of VGAM1120 RNA, herein designated VGAM RNA, also designated SEQ ID:3831.

[40462] Another function of VGAM1120 is therefore inhibition of LOC150271 (Accession XM_097859). Accordingly, utilities of VGAM1120 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150271. LOC199926 (Accession XM_117157) is another VGAM1120 host target gene. LOC199926 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC199926, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199926 BINDING SITE, designated SEQ ID:43260, to the nucleotide sequence of VGAM1120 RNA, herein designated VGAM RNA, also designated SEQ ID:3831.

[40463] Another function of VGAM1120 is therefore inhibition of LOC199926 (Accession XM_117157). Accordingly, utilities of VGAM1120 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199926. LOC202316 (Accession XM_117380) is another VGAM1120 host target gene. LOC202316 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC202316, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC202316 BINDING SITE, designated SEQ ID:43425, to the nucleotide sequence of VGAM1120 RNA, herein designated VGAM RNA, also designated SEQ ID:3831.

[40464] Another function of VGAM1120 is therefore inhibition of LOC202316 (Accession XM_117380). Accordingly, utilities of VGAM1120 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC202316. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1121 (VGAM1121) viral gene, which modulates expression of respective host target genes

thereof, the function and utility of which host target genes is known in the art.

[40465] VGAM1121 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1121 was detected is described hereinabove with reference to Figs. 1-8.

[40466] VGAM1121 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Saimiriine Herpesvirus 2. VGAM1121 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[40467] VGAM1121 gene encodes a VGAM1121 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1121 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1121 precursor RNA is designated SEQ ID:1107, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1107 is located at position 47689 relative to the genome of Saimiriine Herpesvirus 2.

[40468] VGAM1121 precursor RNA folds onto itself, forming VGAM1121 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[40469] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1121 folded precursor RNA into VGAM1121 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM1121 RNA is designated SEQ ID:3832, and is provided hereinbelow with reference to the sequence listing part.

[40470] VGAM1121 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1121 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1121 host target RNA comprises three regions, as is typical of mRNA of a pro-

tein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[40471] VGAM1121 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1121 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1121 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1121 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1121 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[40472] The complementary binding of VGAM1121 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1121 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1121 host target RNA into VGAM1121 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[40473] It is appreciated that VGAM1121 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1121 host target genes. The mRNA of each one of this plurality of VGAM1121 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1121 RNA, herein designated VGAM RNA, and which when bound by VGAM1121 RNA causes inhibition of translation of respective one or more VGAM1121 host target proteins.

[40474] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM1121 gene, herein designated VGAM GENE, on one or more VGAM1121 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[40475] It is yet further appreciated that a function of VGAM1121 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1121 include diagnosis, prevention and treatment of viral infection by Saimiriine Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM1121 correlate with, and may be deduced from, the identity of the host target genes which VGAM1121 binds and inhibits, and the function of these host target genes, as

elaborated hereinbelow.

[40476] Nucleotide sequences of the VGAM1121 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1121 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1121 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1121 are further described hereinbelow with reference to Table 1.

[40477] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1121 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1121 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[40478] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1121 gene, herein designated VGAM is inhibition of expression of VGAM1121 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1121 correlate with, and may be deduced from, the identity of the target genes which VGAM1121 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[40479] A Disintegrin-like and Metalloprotease (reprolysin type) with Thrombospondin Type 1 Motif, 1 (ADAMTS1, Accession NM_006988) is a VGAM1121 host target gene. ADAMTS1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ADAMTS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADAMTS1 BINDING SITE, designated SEQ ID:13850, to the nucleotide sequence of VGAM1121 RNA, herein designated VGAM RNA, also designated SEQ ID:3832.

[40480] A function of VGAM1121 is therefore inhibition of A Disintegrin-like and Metalloprotease (reprolysin type) with Thrombospondin Type 1 Motif, 1 (ADAMTS1, Accession NM_006988). Accordingly, utilities of VGAM1121 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADAMTS1. ATPase, Cu⁺⁺ Transporting, Beta Polypeptide (Wilson disease) (ATP7B, Accession NM_000053) is another VGAM1121 host target gene. ATP7B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ATP7B, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP7B BINDING SITE, designated SEQ ID:5508, to the nucleotide sequence of VGAM1121 RNA, herein designated VGAM RNA, also designated SEQ ID:3832.

[40481] Another function of VGAM1121 is therefore inhibition of ATPase, Cu++ Transporting, Beta Polypeptide (Wilson disease) (ATP7B, Accession NM_000053). Accordingly, utilities of VGAM1121 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP7B. BANK (Accession NM_017935) is another VGAM1121 host target gene. BANK BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BANK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BANK BINDING SITE, designated SEQ ID:19623, to the nucleotide sequence of VGAM1121 RNA, herein designated VGAM RNA, also designated SEQ ID:3832.

[40482] Another function of VGAM1121 is therefore inhibition of BANK (Accession NM_017935). Accordingly, utilities of

VGAM1121 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BANK. Kelch-like 4 (Drosophila) (KLHL4, Accession NM_019117) is another VGAM1121 host target gene. KLHL4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KLHL4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KLHL4 BINDING SITE, designated SEQ ID:21197, to the nucleotide sequence of VGAM1121 RNA, herein designated VGAM RNA, also designated SEQ ID:3832.

[40483] Another function of VGAM1121 is therefore inhibition of Kelch-like 4 (Drosophila) (KLHL4, Accession NM_019117). Accordingly, utilities of VGAM1121 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KLHL4. TEB4 (Accession XM_027156) is another VGAM1121 host target gene. TEB4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TEB4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TEB4

BINDING SITE, designated SEQ ID:30428, to the nucleotide sequence of VGAM1121 RNA, herein designated VGAM RNA, also designated SEQ ID:3832.

[40484] Another function of VGAM1121 is therefore inhibition of TEB4 (Accession XM_027156). Accordingly, utilities of VGAM1121 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TEB4. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1122 (VGAM1122) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[40485] VGAM1122 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1122 was detected is described hereinabove with reference to Figs. 1–8.

[40486] VGAM1122 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Saimiriine Herpesvirus 2. VGAM1122 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[40487] VGAM1122 gene encodes a VGAM1122 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1122 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1122 precursor RNA is designated SEQ ID:1108, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1108 is located at position 43628 relative to the genome of Saimiriine Herpesvirus 2.

[40488] VGAM1122 precursor RNA folds onto itself, forming VGAM1122 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[40489] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1122 folded precursor RNA into VGAM1122 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1122 RNA is designated SEQ ID:3833, and is provided hereinbelow with reference to the sequence listing part.

[40490] VGAM1122 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1122 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1122 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[40491] VGAM1122 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1122 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1122 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1122 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1122 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[40492] The complementary binding of VGAM1122 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1122 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1122 host target RNA into VGAM1122 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[40493] It is appreciated that VGAM1122 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM1122 host target genes. The mRNA of each one of this plurality of VGAM1122 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1122 RNA, herein designated VGAM RNA, and which when bound by VGAM1122 RNA causes inhibition of translation of respective one or more VGAM1122 host target proteins.

[40494] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1122 gene, herein designated VGAM GENE, on one or more VGAM1122 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science
294,779 (2001)).

[40495] It is yet further appreciated that a function of VGAM1122 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1122 include diagnosis, prevention and treatment of viral infection by Saimiriine Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM1122 correlate with, and may be deduced from, the identity of the host target genes which VGAM1122 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[40496] Nucleotide sequences of the VGAM1122 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1122 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1122 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1122 are further described hereinbelow with reference to Table 1.

[40497] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1122 host target RNA, and schematic representation of the complementarity of each

of these host target binding sites to VGAM1122 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[40498] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1122 gene, herein designated VGAM is inhibition of expression of VGAM1122 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1122 correlate with, and may be deduced from, the identity of the target genes which VGAM1122 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[40499] Calumenin (CALU, Accession NM_001219) is a VGAM1122 host target gene. CALU BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CALU, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CALU BINDING SITE, designated SEQ ID:6882, to the nucleotide sequence of VGAM1122 RNA, herein designated VGAM RNA, also designated SEQ ID:3833.

[40500] A function of VGAM1122 is therefore inhibition of Calumenin (CALU, Accession NM_001219), a gene which binds

7 calcium ions with a low affinity with unidentified function. Accordingly, utilities of VGAM1122 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CALU. The function of CALU and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM253. V-raf-1 Murine Leukemia Viral Oncogene Homolog 1 (RAF1, Accession XM_087425) is another VGAM1122 host target gene. RAF1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RAF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAF1 BINDING SITE, designated SEQ ID:39245, to the nucleotide sequence of VGAM1122 RNA, herein designated VGAM RNA, also designated SEQ ID:3833.

[40501] Another function of VGAM1122 is therefore inhibition of V-raf-1 Murine Leukemia Viral Oncogene Homolog 1 (RAF1, Accession XM_087425). Accordingly, utilities of VGAM1122 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAF1. DKFZp761P1010 (Accession NM_018423) is another

VGAM1122 host target gene. DKFZp761P1010 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp761P1010, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp761P1010 BINDING SITE, designated SEQ ID:20477, to the nucleotide sequence of VGAM1122 RNA, herein designated VGAM RNA, also designated SEQ ID:3833.

[40502] Another function of VGAM1122 is therefore inhibition of DKFZp761P1010 (Accession NM_018423). Accordingly, utilities of VGAM1122 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761P1010. HTMP10 (Accession NM_033207) is another VGAM1122 host target gene. HTMP10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HTMP10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HTMP10 BINDING SITE, designated SEQ ID:27049, to the nucleotide sequence of VGAM1122 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3833.

[40503] Another function of VGAM1122 is therefore inhibition of HTMP10 (Accession NM_033207). Accordingly, utilities of VGAM1122 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HTMP10. KIAA0471 (Accession NM_014857) is another VGAM1122 host target gene. KIAA0471 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0471, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0471 BINDING SITE, designated SEQ ID:16907, to the nucleotide sequence of VGAM1122 RNA, herein designated VGAM RNA, also designated SEQ ID:3833.

[40504] Another function of VGAM1122 is therefore inhibition of KIAA0471 (Accession NM_014857). Accordingly, utilities of VGAM1122 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0471. KIAA1676 (Accession XM_167612) is another VGAM1122 host target gene. KIAA1676 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1676, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1676 BINDING SITE, designated SEQ ID:44726, to the nucleotide sequence of VGAM1122 RNA, herein designated VGAM RNA, also designated SEQ ID:3833.

[40505] Another function of VGAM1122 is therefore inhibition of KIAA1676 (Accession XM_167612). Accordingly, utilities of VGAM1122 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1676. LOC115294 (Accession XM_054302) is another VGAM1122 host target gene. LOC115294 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC115294, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC115294 BINDING SITE, designated SEQ ID:36143, to the nucleotide sequence of VGAM1122 RNA, herein designated VGAM RNA, also designated SEQ ID:3833.

[40506] Another function of VGAM1122 is therefore inhibition of LOC115294 (Accession XM_054302). Accordingly, utilities of VGAM1122 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC115294. LOC121536 (Accession XM_058567) is another VGAM1122 host target gene. LOC121536 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC121536, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC121536 BINDING SITE, designated SEQ ID:36664, to the nucleotide sequence of VGAM1122 RNA, herein designated VGAM RNA, also designated SEQ ID:3833.

[40507] Another function of VGAM1122 is therefore inhibition of LOC121536 (Accession XM_058567). Accordingly, utilities of VGAM1122 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC121536. LOC148936 (Accession XM_097556) is another VGAM1122 host target gene. LOC148936 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC148936, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148936 BINDING SITE, designated SEQ ID:40929, to

the nucleotide sequence of VGAM1122 RNA, herein designated VGAM RNA, also designated SEQ ID:3833.

[40508] Another function of VGAM1122 is therefore inhibition of LOC148936 (Accession XM_097556). Accordingly, utilities of VGAM1122 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148936. LOC148938 (Accession XM_097555) is another VGAM1122 host target gene. LOC148938 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC148938, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148938 BINDING SITE, designated SEQ ID:40922, to the nucleotide sequence of VGAM1122 RNA, herein designated VGAM RNA, also designated SEQ ID:3833.

[40509] Another function of VGAM1122 is therefore inhibition of LOC148938 (Accession XM_097555). Accordingly, utilities of VGAM1122 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148938. LOC152674 (Accession XM_098251) is another VGAM1122 host target gene. LOC152674 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by LOC152674, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152674 BINDING SITE, designated SEQ ID:41536, to the nucleotide sequence of VGAM1122 RNA, herein designated VGAM RNA, also designated SEQ ID:3833.

[40510] Another function of VGAM1122 is therefore inhibition of LOC152674 (Accession XM_098251). Accordingly, utilities of VGAM1122 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152674. LOC254100 (Accession XM_172851) is another VGAM1122 host target gene. LOC254100 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC254100, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254100 BINDING SITE, designated SEQ ID:46127, to the nucleotide sequence of VGAM1122 RNA, herein designated VGAM RNA, also designated SEQ ID:3833.

[40511] Another function of VGAM1122 is therefore inhibition of LOC254100 (Accession XM_172851). Accordingly, utilities

of VGAM1122 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254100. LOC92249 (Accession XM_043814) is another VGAM1122 host target gene. LOC92249 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC92249, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92249 BINDING SITE, designated SEQ ID:34024, to the nucleotide sequence of VGAM1122 RNA, herein designated VGAM RNA, also designated SEQ ID:3833.

[40512] Another function of VGAM1122 is therefore inhibition of LOC92249 (Accession XM_043814). Accordingly, utilities of VGAM1122 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92249. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1123 (VGAM1123) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[40513] VGAM1123 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1123 was detected is described hereinabove with reference to Figs. 1-8.

[40514] VGAM1123 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Saimiriine Herpesvirus 2. VGAM1123 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[40515] VGAM1123 gene encodes a VGAM1123 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1123 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1123 precursor RNA is designated SEQ ID:1109, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1109 is located at position 45011 relative to the genome of Saimiriine Herpesvirus 2.

[40516] VGAM1123 precursor RNA folds onto itself, forming VGAM1123 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the

art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[40517] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1123 folded precursor RNA into VGAM1123 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1123 RNA is designated SEQ ID:3834, and is provided hereinbelow with reference to the sequence listing part.

[40518] VGAM1123 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1123 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1123 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated

5`UTR, PROTEIN CODING and 3`UTR respectively.

[40519] VGAM1123 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1123 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1123 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1123 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1123 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[40520] The complementary binding of VGAM1123 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1123 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1123 host target RNA into VGAM1123 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[40521] It is appreciated that VGAM1123 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1123 host target genes. The mRNA of each one of this plurality of VGAM1123 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1123 RNA, herein designated VGAM RNA, and which when bound by VGAM1123 RNA causes inhibition of translation of respective one or more VGAM1123 host target proteins.

[40522] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1123 gene, herein designated VGAM GENE, on one or more VGAM1123 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[40523] It is yet further appreciated that a function of VGAM1123 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1123 include diagnosis, prevention and treatment of viral infection by Saimiriine Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM1123 correlate with, and may be deduced from, the identity of the host target genes which VGAM1123 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[40524] Nucleotide sequences of the VGAM1123 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the
`diced` VGAM1123 RNA, herein designated VGAM RNA,
and a schematic representation of the secondary folding
of VGAM1123 folded precursor RNA, herein designated
VGAM FOLDED PRECURSOR RNA, of VGAM1123 are further
described hereinbelow with reference to Table 1.

[40525] Nucleotide sequences of host target binding sites, such as
BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of
Fig. 1, found on VGAM1123 host target RNA, and
schematic representation of the complementarity of each
of these host target binding sites to VGAM1123 RNA,
herein designated VGAM RNA, are described hereinbelow
with reference to Table 2.

[40526] As mentioned hereinabove with reference to Fig. 1, a
function of VGAM1123 gene, herein designated VGAM is
inhibition of expression of VGAM1123 target genes. It is
appreciated that specific functions, and accordingly utili-
ties, of VGAM1123 correlate with, and may be deduced
from, the identity of the target genes which VGAM1123
binds and inhibits, and the function of these target genes,
as elaborated hereinbelow.

[40527] Caspase 2, Apoptosis-related Cysteine Protease (neural
precursor cell expressed, developmentally down-reg-

ulated 2) (CASP2, Accession NM_001224) is a VGAM1123 host target gene. CASP2 BINDING SITE1 through CASP2 BINDING SITE4 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by CASP2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CASP2 BINDING SITE1 through CASP2 BINDING SITE4, designated SEQ ID:6890, SEQ ID:26853, SEQ ID:26858 and SEQ ID:26863 respectively, to the nucleotide sequence of VGAM1123 RNA, herein designated VGAM RNA, also designated SEQ ID:3834.

[40528] A function of VGAM1123 is therefore inhibition of Caspase 2, Apoptosis-related Cysteine Protease (neural precursor cell expressed, developmentally down-regulated 2) (CASP2, Accession NM_001224), a gene which involves in the activation cascade of caspases responsible for apoptosis execution. Accordingly, utilities of VGAM1123 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CASP2. The function of CASP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to

VGAM148.Eukaryotic Translation Initiation Factor 1A (EIF1A, Accession XM_114147) is another VGAM1123 host target gene. EIF1A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EIF1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EIF1A BINDING SITE, designated SEQ ID:42720, to the nucleotide sequence of VGAM1123 RNA, herein designated VGAM RNA, also designated SEQ ID:3834.

[40529] Another function of VGAM1123 is therefore inhibition of Eukaryotic Translation Initiation Factor 1A (EIF1A, Accession XM_114147), a gene which seems to be required for maximal rate of protein biosynthesis. Accordingly, utilities of VGAM1123 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EIF1A. The function of EIF1A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM120.FK506 Binding Protein 12-rapamycin Associated Protein 1 (FRAP1, Accession NM_004958) is another VGAM1123 host target gene. FRAP1 BINDING SITE

is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FRAP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FRAP1 BINDING SITE, designated SEQ ID:11403, to the nucleotide sequence of VGAM1123 RNA, herein designated VGAM RNA, also designated SEQ ID:3834.

[40530] Another function of VGAM1123 is therefore inhibition of FK506 Binding Protein 12-rapamycin Associated Protein 1 (FRAP1, Accession NM_004958), a gene which acts as the target for the cell-cycle arrest and immunosuppressive effects of the fkbp12-rapamycin complex. Accordingly, utilities of VGAM1123 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FRAP1. The function of FRAP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM496. High-mobility Group 20A (HMG20A, Accession NM_018200) is another VGAM1123 host target gene. HMG20A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HMG20A, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HMG20A BINDING SITE, designated SEQ ID:20073, to the nucleotide sequence of VGAM1123 RNA, herein designated VGAM RNA, also designated SEQ ID:3834.

[40531] Another function of VGAM1123 is therefore inhibition of High-mobility Group 20A (HMG20A, Accession NM_018200). Accordingly, utilities of VGAM1123 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HMG20A. Reelin (RELN, Accession XM_168628) is another VGAM1123 host target gene. RELN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RELN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RELN BINDING SITE, designated SEQ ID:45280, to the nucleotide sequence of VGAM1123 RNA, herein designated VGAM RNA, also designated SEQ ID:3834.

[40532] Another function of VGAM1123 is therefore inhibition of Reelin (RELN, Accession XM_168628), a gene which regulates microtubule function in neurons and neuronal mi-

gration. Accordingly, utilities of VGAM1123 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RELN. The function of RELN and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM35.DCOHM (Accession NM_032151) is another VGAM1123 host target gene. DCOHM BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DCOHM, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DCOHM BINDING SITE, designated SEQ ID:25842, to the nucleotide sequence of VGAM1123 RNA, herein designated VGAM RNA, also designated SEQ ID:3834.

[40533] Another function of VGAM1123 is therefore inhibition of DCOHM (Accession NM_032151). Accordingly, utilities of VGAM1123 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DCOHM. HTGN29 (Accession NM_020199) is another VGAM1123 host target gene. HTGN29 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by HTGN29, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HTGN29 BINDING SITE, designated SEQ ID:21432, to the nucleotide sequence of VGAM1123 RNA, herein designated VGAM RNA, also designated SEQ ID:3834.

[40534] Another function of VGAM1123 is therefore inhibition of HTGN29 (Accession NM_020199). Accordingly, utilities of VGAM1123 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HTGN29. KIAA1728 (Accession XM_043492) is another VGAM1123 host target gene. KIAA1728 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1728, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1728 BINDING SITE, designated SEQ ID:33949, to the nucleotide sequence of VGAM1123 RNA, herein designated VGAM RNA, also designated SEQ ID:3834.

[40535] Another function of VGAM1123 is therefore inhibition of KIAA1728 (Accession XM_043492). Accordingly, utilities

of VGAM1123 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1728. LOC145483 (Accession XM_085156) is another VGAM1123 host target gene. LOC145483 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145483, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145483 BINDING SITE, designated SEQ ID:37879, to the nucleotide sequence of VGAM1123 RNA, herein designated VGAM RNA, also designated SEQ ID:3834.

[40536] Another function of VGAM1123 is therefore inhibition of LOC145483 (Accession XM_085156). Accordingly, utilities of VGAM1123 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145483. LOC145757 (Accession XM_085227) is another VGAM1123 host target gene. LOC145757 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC145757, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC145757 BINDING SITE, designated SEQ ID:37967, to the nucleotide sequence of VGAM1123 RNA, herein designated VGAM RNA, also designated SEQ ID:3834.

[40537] Another function of VGAM1123 is therefore inhibition of LOC145757 (Accession XM_085227). Accordingly, utilities of VGAM1123 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145757. LOC153883 (Accession XM_087798) is another VGAM1123 host target gene. LOC153883 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC153883, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153883 BINDING SITE, designated SEQ ID:39429, to the nucleotide sequence of VGAM1123 RNA, herein designated VGAM RNA, also designated SEQ ID:3834.

[40538] Another function of VGAM1123 is therefore inhibition of LOC153883 (Accession XM_087798). Accordingly, utilities of VGAM1123 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153883. LOC166793 (Accession NM_145291) is another VGAM1123 host target gene. LOC166793 BINDING

SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC166793, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC166793 BINDING SITE, designated SEQ ID:29804, to the nucleotide sequence of VGAM1123 RNA, herein designated VGAM RNA, also designated SEQ ID:3834.

[40539] Another function of VGAM1123 is therefore inhibition of LOC166793 (Accession NM_145291). Accordingly, utilities of VGAM1123 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC166793. LOC219699 (Accession XM_172822) is another VGAM1123 host target gene. LOC219699 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC219699, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219699 BINDING SITE, designated SEQ ID:46100, to the nucleotide sequence of VGAM1123 RNA, herein designated VGAM RNA, also designated SEQ ID:3834.

[40540] Another function of VGAM1123 is therefore inhibition of

LOC219699 (Accession XM_172822). Accordingly, utilities of VGAM1123 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219699. LOC51054 (Accession NM_015899) is another VGAM1123 host target gene. LOC51054 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC51054, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51054 BINDING SITE, designated SEQ ID:18043, to the nucleotide sequence of VGAM1123 RNA, herein designated VGAM RNA, also designated SEQ ID:3834.

[40541] Another function of VGAM1123 is therefore inhibition of LOC51054 (Accession NM_015899). Accordingly, utilities of VGAM1123 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51054. LOC51691 (Accession NM_016200) is another VGAM1123 host target gene. LOC51691 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51691, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of LOC51691 BINDING SITE, designated SEQ ID:18291, to the nucleotide sequence of VGAM1123 RNA, herein designated VGAM RNA, also designated SEQ ID:3834.

[40542] Another function of VGAM1123 is therefore inhibition of LOC51691 (Accession NM_016200). Accordingly, utilities of VGAM1123 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51691. LOC90786 (Accession XM_034127) is another VGAM1123 host target gene. LOC90786 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC90786, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90786 BINDING SITE, designated SEQ ID:32015, to the nucleotide sequence of VGAM1123 RNA, herein designated VGAM RNA, also designated SEQ ID:3834.

[40543] Another function of VGAM1123 is therefore inhibition of LOC90786 (Accession XM_034127). Accordingly, utilities of VGAM1123 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90786. LOC92465 (Accession XM_045250) is another

VGAM1123 host target gene. LOC92465 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC92465, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92465 BINDING SITE, designated SEQ ID:34393, to the nucleotide sequence of VGAM1123 RNA, herein designated VGAM RNA, also designated SEQ ID:3834.

[40544] Another function of VGAM1123 is therefore inhibition of LOC92465 (Accession XM_045250). Accordingly, utilities of VGAM1123 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92465. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1124 (VGAM1124) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[40545] VGAM1124 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1124 was detected is de-

scribed hereinabove with reference to Figs. 1–8.

[40546] VGAM1124 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Saimiriine Herpesvirus 2. VGAM1124 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[40547] VGAM1124 gene encodes a VGAM1124 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1124 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1124 precursor RNA is designated SEQ ID:1110, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1110 is located at position 43302 relative to the genome of Saimiriine Herpesvirus 2.

[40548] VGAM1124 precursor RNA folds onto itself, forming VGAM1124 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA

gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[40549] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1124 folded precursor RNA into VGAM1124 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM1124 RNA is designated SEQ ID:3835, and is provided hereinbelow with reference to the sequence listing part.

[40550] VGAM1124 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1124 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1124 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[40551] VGAM1124 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM1124 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1124 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1124 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1124 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[40552] The complementary binding of VGAM1124 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1124 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1124 host target RNA into VGAM1124 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[40553] It is appreciated that VGAM1124 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1124 host target genes. The mRNA of each one of this plurality of VGAM1124 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1124 RNA, herein designated VGAM RNA, and which when bound by VGAM1124 RNA causes inhibition of translation of respective one or more VGAM1124 host target proteins.

[40554] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1124 gene, herein designated VGAM GENE, on one or more VGAM1124 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[40555] It is yet further appreciated that a function of VGAM1124 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1124 include diagnosis, prevention and treatment of viral infection by Saimiriine Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM1124 correlate with, and may be deduced from, the identity of the host target genes which VGAM1124 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[40556] Nucleotide sequences of the VGAM1124 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1124 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding

of VGAM1124 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1124 are further described hereinbelow with reference to Table 1.

[40557] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1124 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1124 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[40558] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1124 gene, herein designated VGAM is inhibition of expression of VGAM1124 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1124 correlate with, and may be deduced from, the identity of the target genes which VGAM1124 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[40559] DEAD/H (Asp-Glu-Ala-Asp/His) Box Polypeptide 34 (DDX34, Accession NM_014681) is a VGAM1124 host target gene. DDX34 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DDX34, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DDX34 BINDING SITE, designated SEQ ID:16158, to the nucleotide sequence of VGAM1124 RNA, herein designated VGAM RNA, also designated SEQ ID:3835.

[40560] A function of VGAM1124 is therefore inhibition of DEAD/H (Asp-Glu-Ala-Asp/His) Box Polypeptide 34 (DDX34, Accession NM_014681). Accordingly, utilities of VGAM1124 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DDX34. Endothelial Differentiation, Lysophosphatidic Acid G-protein-coupled Receptor, 2 (EDG2, Accession NM_057159) is another VGAM1124 host target gene. EDG2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by EDG2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EDG2 BINDING SITE, designated SEQ ID:27669, to the nucleotide sequence of VGAM1124 RNA, herein designated VGAM RNA, also designated SEQ ID:3835.

[40561] Another function of VGAM1124 is therefore inhibition of

Endothelial Differentiation, Lysophosphatidic Acid G-protein-coupled Receptor, 2 (EDG2, Accession NM_057159). Accordingly, utilities of VGAM1124 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EDG2. ICK (Accession NM_014920) is another VGAM1124 host target gene. ICK BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ICK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ICK BINDING SITE, designated SEQ ID:17191, to the nucleotide sequence of VGAM1124 RNA, herein designated VGAM RNA, also designated SEQ ID:3835.

[40562] Another function of VGAM1124 is therefore inhibition of ICK (Accession NM_014920). Accordingly, utilities of VGAM1124 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ICK. LOC112687 (Accession XM_053145) is another VGAM1124 host target gene. LOC112687 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC112687, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC112687 BINDING SITE, designated SEQ ID:36064, to the nucleotide sequence of VGAM1124 RNA, herein designated VGAM RNA, also designated SEQ ID:3835.

[40563] Another function of VGAM1124 is therefore inhibition of LOC112687 (Accession XM_053145). Accordingly, utilities of VGAM1124 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC112687. LOC220692 (Accession XM_165991) is another VGAM1124 host target gene. LOC220692 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC220692, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220692 BINDING SITE, designated SEQ ID:43831, to the nucleotide sequence of VGAM1124 RNA, herein designated VGAM RNA, also designated SEQ ID:3835.

[40564] Another function of VGAM1124 is therefore inhibition of LOC220692 (Accession XM_165991). Accordingly, utilities of VGAM1124 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC220692. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1125 (VGAM1125) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[40565] VGAM1125 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1125 was detected is described hereinabove with reference to Figs. 1–8.

[40566] VGAM1125 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Saimiriine Herpesvirus 2. VGAM1125 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[40567] VGAM1125 gene encodes a VGAM1125 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1125 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1125 precursor RNA is designated SEQ ID:1111, and is provided hereinbelow with ref–

erence to the sequence listing part. Nucleotide sequence SEQ ID:1111 is located at position 42164 relative to the genome of Saimiriine Herpesvirus 2.

[40568] VGAM1125 precursor RNA folds onto itself, forming VGAM1125 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[40569] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1125 folded precursor RNA into VGAM1125 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 51%) nucleotide sequence of VGAM1125 RNA is designated SEQ ID:3836, and is provided hereinbelow with reference to the sequence listing part.

[40570] VGAM1125 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1125 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1125 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[40571] VGAM1125 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1125 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1125 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1125 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM1125 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[40572] The complementary binding of VGAM1125 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1125 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1125 host target RNA into VGAM1125 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[40573] It is appreciated that VGAM1125 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1125 host target genes. The mRNA of each one of this plurality of VGAM1125 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1125 RNA, herein designated VGAM RNA, and which when bound by VGAM1125 RNA causes

inhibition of translation of respective one or more VGAM1125 host target proteins.

[40574] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1125 gene, herein designated VGAM GENE, on one or more VGAM1125 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[40575] It is yet further appreciated that a function of VGAM1125 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1125 include diagnosis, prevention and

treatment of viral infection by Saimiriine Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM1125 correlate with, and may be deduced from, the identity of the host target genes which VGAM1125 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[40576] Nucleotide sequences of the VGAM1125 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1125 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1125 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1125 are further described hereinbelow with reference to Table 1.

[40577] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1125 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1125 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[40578] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1125 gene, herein designated VGAM is inhibition of expression of VGAM1125 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM1125 correlate with, and may be deduced from, the identity of the target genes which VGAM1125 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[40579] B-cell CLL/lymphoma 11B (zinc finger protein) (BCL11B, Accession NM_022898) is a VGAM1125 host target gene. BCL11B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BCL11B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCL11B BINDING SITE, designated SEQ ID:23165, to the nucleotide sequence of VGAM1125 RNA, herein designated VGAM RNA, also designated SEQ ID:3836.

[40580] A function of VGAM1125 is therefore inhibition of B-cell CLL/lymphoma 11B (zinc finger protein) (BCL11B, Accession NM_022898). Accordingly, utilities of VGAM1125 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCL11B. Collagen, Type IV, Alpha 4 (COL4A4, Accession NM_000092) is another VGAM1125 host target gene. COL4A4 BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by COL4A4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COL4A4 BINDING SITE, designated SEQ ID:5550, to the nucleotide sequence of VGAM1125 RNA, herein designated VGAM RNA, also designated SEQ ID:3836.

[40581] Another function of VGAM1125 is therefore inhibition of Collagen, Type IV, Alpha 4 (COL4A4, Accession NM_000092). Accordingly, utilities of VGAM1125 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COL4A4. Ectodermal-neural Cortex (with BTB-like domain) (ENC1, Accession NM_003633) is another VGAM1125 host target gene. ENC1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ENC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ENC1 BINDING SITE, designated SEQ ID:9699, to the nucleotide sequence of VGAM1125 RNA, herein designated VGAM RNA, also designated SEQ ID:3836.

[40582] Another function of VGAM1125 is therefore inhibition of Ectodermal–neural Cortex (with BTB–like domain) (ENC1, Accession NM_003633), a gene which is an actin–binding protein involved in the regulation of neuronal process formation and in differentiation of neural crest cells. Accordingly, utilities of VGAM1125 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ENC1. The function of ENC1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM233. G Protein–coupled Receptor 23 (GPR23, Accession XM_018505) is another VGAM1125 host target gene. GPR23 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GPR23, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GPR23 BINDING SITE, designated SEQ ID:30363, to the nucleotide sequence of VGAM1125 RNA, herein designated VGAM RNA, also designated SEQ ID:3836.

[40583] Another function of VGAM1125 is therefore inhibition of G Protein–coupled Receptor 23 (GPR23, Accession

XM_018505), a gene which is a member of the G protein-coupled receptor family. Accordingly, utilities of VGAM1125 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPR23. The function of GPR23 has been established by previous studies. By searching the expressed sequence tag database, Janssens et al. (1997) found an EST bearing 63% amino-acid identity with the chicken P2Y(5) receptor. By high-stringency PCR using primers based on this EST, Janssens et al. (1997) isolated a complete clone from human genomic DNA. The sequence was 61% identical to the chicken P2Y(5) receptor and 30–33% identical to other P2Y subtypes. O'Dowd et al. (1997) mapped the GPR23 gene to Xq13–q21.1 by fluorescence in situ hybridization.

[40584] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[40585] Janssens, R.; Boeynaems, J.–M.; Godart, M.; Communi, D. : Cloning of a human heptahelical receptor closely related to the P2Y(5) receptor. *Biochem. Biophys. Res. Commun.* 236: 106–112, 1997. ; and

[40586] O'Dowd, B. F.; Nguyen, T.; Jung, B. P.; Marchese, A.; Cheng, R.; Heng, H. H. Q.; Kolakowski, L. F., Jr.; Lynch, K.

R.; George, S. R. : Cloning and chromosomal mapping of four putative n.

[40587] Further studies establishing the function and utilities of GPR23 are found in John Hopkins OMIM database record ID 300086, and in cited publications numbered 10977–10978 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Src-like-adaptor 2 (SLA2, Accession NM_032214) is another VGAM1125 host target gene. SLA2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLA2 BINDING SITE, designated SEQ ID:25942, to the nucleotide sequence of VGAM1125 RNA, herein designated VGAM RNA, also designated SEQ ID:3836.

[40588] Another function of VGAM1125 is therefore inhibition of Src-like-adaptor 2 (SLA2, Accession NM_032214). Accordingly, utilities of VGAM1125 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLA2. Serine Racemase (SRR, Accession NM_021947) is another VGAM1125 host target gene. SRR

BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SRR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SRR BINDING SITE, designated SEQ ID:22476, to the nucleotide sequence of VGAM1125 RNA, herein designated VGAM RNA, also designated SEQ ID:3836.

[40589] Another function of VGAM1125 is therefore inhibition of Serine Racemase (SRR, Accession NM_021947). Accordingly, utilities of VGAM1125 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SRR. WSX1 (Accession NM_004843) is another VGAM1125 host target gene. WSX1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by WSX1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WSX1 BINDING SITE, designated SEQ ID:11255, to the nucleotide sequence of VGAM1125 RNA, herein designated VGAM RNA, also designated SEQ ID:3836.

[40590] Another function of VGAM1125 is therefore inhibition of

WSX1 (Accession NM_004843), a gene which is a member of the class I cytokine receptor family and involved in the modulation of the immune response. Accordingly, utilities of VGAM1125 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WSX1. The function of WSX1 has been established by previous studies. CD4⁺ helper T cells differentiate into type 1 (Th1) cells, critical for cell-mediated immunity, predominantly under the influence of IL12 (OMIM Ref. No. 161560). IL4 (OMIM Ref. No. 147780) influences their differentiation into type 2 (Th2) cells, critical for most antibody responses. Mice deficient in these cytokines, their receptors, or associated transcription factors have impaired, but not absent, Th1 or Th2 immune responses. Sprecher et al. (1998) searched an EST database for sequences similar to the class I cytokine receptor gp130 (OMIM Ref. No. 600694). They identified a cDNA encoding a class I cytokine receptor, which they designated WSX1, from an infant brain cDNA library. Using a homology screen, Chen et al. (2000) identified TCCR (T-cell cytokine receptor), a type I cytokine receptor family member identical to WSX1 and most homologous (26% identity, 37% similarity) to IL12RB2 (OMIM Ref. No. 601642). By screen-

ing a peripheral blood leukocyte (PBL) library, Chen et al. (2000) isolated a full-length cDNA encoding a deduced 636-amino acid TCCR protein. Sequence analysis predicted a single transmembrane domain, a WSX signature motif, and 7 potential N-glycosylation sites in its extracellular domain, and a box1 motif in its intracellular region. Mouse Tccr, isolated from a spleen library, is 62% identical to the human sequence. Northern blot analysis revealed expression of a 3.5-kb transcript in human PBL, thymus, and spleen as well as in adult and fetal lung. Real-time PCR analysis of mouse splenocytes revealed highest expression in CD4⁺ T cells and in natural killer cells. Among CD4⁺ T cells, expression was highest in undifferentiated (Th0) cells, with reduced expression in Th1 and Th2 cells. Animal model experiments lend further support to the function of WSX1. Yoshida et al. (2001) generated mice deficient in *Wsx1* by homologous recombination. *Wsx1*-deficient mice were apparently normal and healthy. In vitro immunologic analysis showed that the *Wsx1* ^{-/-} mice had weak IFNG primary responses but normal secondary responses to mitogen compared with wild-type mice. In response to *Leishmania* infection, mice lacking *Wsx1* were more susceptible than wildtype mice and

had weak early IFNG responses. The footpads were enlarged with severe ulceration. The phenotype was not as severe as that of Balb-c mice. RT-PCR analysis indicated that high early IL4 levels were maintained in the knockout mice. Infection with the avirulent *Mycobacterium bovis* BCG resulted in numerous enlarged and poorly differentiated liver granulomas in *Wsx1* $-/-$ mice compared with wildtype. However, there was no significant difference in bacterial numbers or in liver damage as assessed by transaminase levels. Yoshida et al. (2001) concluded that the impact of lack of *Wsx1* early in response to infectious agents is significant, but the impact is mitigated by the presence of other cytokines, such as IFNG and IL12, and their receptors in later phases of the infection.

[40591] It is appreciated that the abovementioned animal model for *WSX1* is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[40592] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[40593] Sprecher, C. A.; Grant, F. J.; Baumgartner, J. W.; Presnell, S. R.; Schrader, S. K.; Yamagiwa, T.; Whitmore, T. E.; O'Hara,

P. J.; Foster, D. F. : Cloning and characterization of a novel class I cytokine receptor. Biochem. Biophys. Res. Comm. 246: 82–90, 1998. ; and

[40594] Yoshida, H.; Hamano, S.; Senaldi, G.; Covey, T.; Faggioni, R.; Mu, S.; Xia, M.; Wakeham, A. C.; Nishina, H.; Potter, J.; Saris, C. J. M.; Mak, T. W. : WSX–1 is required for the initiation.

[40595] Further studies establishing the function and utilities of WSX1 are found in John Hopkins OMIM database record ID 605350, and in cited publications numbered 6180–6182 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Betaine–homocysteine Methyltransferase (BHMT, Accession NM_001713) is another VGAM1125 host target gene. BHMT BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BHMT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BHMT BINDING SITE, designated SEQ ID:7444, to the nucleotide sequence of VGAM1125 RNA, herein designated VGAM RNA, also designated SEQ ID:3836.

[40596] Another function of VGAM1125 is therefore inhibition of

Betaine-homocysteine Methyltransferase (BHMT, Accession NM_001713). Accordingly, utilities of VGAM1125 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BHMT. Chemokine (C-C motif) Receptor 5 (CCR5, Accession NM_000579) is another VGAM1125 host target gene. CCR5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CCR5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CCR5 BINDING SITE, designated SEQ ID:6184, to the nucleotide sequence of VGAM1125 RNA, herein designated VGAM RNA, also designated SEQ ID:3836.

[40597] Another function of VGAM1125 is therefore inhibition of Chemokine (C-C motif) Receptor 5 (CCR5, Accession NM_000579). Accordingly, utilities of VGAM1125 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CCR5. CEP3 (Accession NM_006449) is another VGAM1125 host target gene. CEP3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CEP3, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CEP3 BINDING SITE, designated SEQ ID:13159, to the nucleotide sequence of VGAM1125 RNA, herein designated VGAM RNA, also designated SEQ ID:3836.

[40598] Another function of VGAM1125 is therefore inhibition of CEP3 (Accession NM_006449). Accordingly, utilities of VGAM1125 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CEP3. KIAA1948 (Accession XM_091984) is another VGAM1125 host target gene. KIAA1948 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1948, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1948 BINDING SITE, designated SEQ ID:40080, to the nucleotide sequence of VGAM1125 RNA, herein designated VGAM RNA, also designated SEQ ID:3836.

[40599] Another function of VGAM1125 is therefore inhibition of KIAA1948 (Accession XM_091984). Accordingly, utilities of VGAM1125 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA1948. Zinc Finger Protein 185 (LIM domain) (ZNF185, Accession NM_007150) is another VGAM1125 host target gene. ZNF185 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF185, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF185 BINDING SITE, designated SEQ ID:14001, to the nucleotide sequence of VGAM1125 RNA, herein designated VGAM RNA, also designated SEQ ID:3836.

[40600] Another function of VGAM1125 is therefore inhibition of Zinc Finger Protein 185 (LIM domain) (ZNF185, Accession NM_007150). Accordingly, utilities of VGAM1125 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF185. LOC126964 (Accession XM_059100) is another VGAM1125 host target gene. LOC126964 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC126964, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC126964 BINDING SITE, desig-

nated SEQ ID:36883, to the nucleotide sequence of VGAM1125 RNA, herein designated VGAM RNA, also designated SEQ ID:3836.

[40601] Another function of VGAM1125 is therefore inhibition of LOC126964 (Accession XM_059100). Accordingly, utilities of VGAM1125 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC126964. LOC150848 (Accession XM_097959) is another VGAM1125 host target gene. LOC150848 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150848, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150848 BINDING SITE, designated SEQ ID:41250, to the nucleotide sequence of VGAM1125 RNA, herein designated VGAM RNA, also designated SEQ ID:3836.

[40602] Another function of VGAM1125 is therefore inhibition of LOC150848 (Accession XM_097959). Accordingly, utilities of VGAM1125 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150848. LOC151248 (Accession XM_087143) is another VGAM1125 host target gene. LOC151248 BINDING

SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC151248, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151248 BINDING SITE, designated SEQ ID:39083, to the nucleotide sequence of VGAM1125 RNA, herein designated VGAM RNA, also designated SEQ ID:3836.

[40603] Another function of VGAM1125 is therefore inhibition of LOC151248 (Accession XM_087143). Accordingly, utilities of VGAM1125 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151248. LOC153222 (Accession XM_087631) is another VGAM1125 host target gene. LOC153222 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC153222, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153222 BINDING SITE, designated SEQ ID:39367, to the nucleotide sequence of VGAM1125 RNA, herein designated VGAM RNA, also designated SEQ ID:3836.

[40604] Another function of VGAM1125 is therefore inhibition of

LOC153222 (Accession XM_087631). Accordingly, utilities of VGAM1125 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153222. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1126 (VGAM1126) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[40605] VGAM1126 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1126 was detected is described hereinabove with reference to Figs. 1-8.

[40606] VGAM1126 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ononis Yellow Mosaic Virus. VGAM1126 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[40607] VGAM1126 gene encodes a VGAM1126 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1126 precursor RNA does not encode a protein. A

nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1126 precursor RNA is designated SEQ ID:1112, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1112 is located at position 5517 relative to the genome of Ononis Yellow Mosaic Virus.

[40608] VGAM1126 precursor RNA folds onto itself, forming VGAM1126 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[40609] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1126 folded precursor RNA into VGAM1126 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide se-

quence of VGAM1126 RNA is designated SEQ ID:3837, and is provided hereinbelow with reference to the sequence listing part.

[40610] VGAM1126 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1126 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1126 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[40611] VGAM1126 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1126 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1126 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting – VGAM1126 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1126 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[40612] The complementary binding of VGAM1126 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1126 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1126 host target RNA into VGAM1126 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[40613] It is appreciated that VGAM1126 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1126 host target genes. The mRNA of each one of this plurality of VGAM1126 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM1126 RNA, herein designated VGAM RNA, and which when bound by VGAM1126 RNA causes inhibition of translation of respective one or more VGAM1126 host target proteins.

[40614] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1126 gene, herein designated VGAM GENE, on one or more VGAM1126 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[40615] It is yet further appreciated that a function of VGAM1126

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1126 include diagnosis, prevention and treatment of viral infection by Ononis Yellow Mosaic Virus. Specific functions, and accordingly utilities, of VGAM1126 correlate with, and may be deduced from, the identity of the host target genes which VGAM1126 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[40616] Nucleotide sequences of the VGAM1126 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1126 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1126 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1126 are further described hereinbelow with reference to Table 1.

[40617] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1126 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1126 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[40618] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1126 gene, herein designated VGAM is inhibition of expression of VGAM1126 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1126 correlate with, and may be deduced from, the identity of the target genes which VGAM1126 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[40619] Adenylate Kinase 1 (AK1, Accession NM_000476) is a VGAM1126 host target gene. AK1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AK1 BINDING SITE, designated SEQ ID:6086, to the nucleotide sequence of VGAM1126 RNA, herein designated VGAM RNA, also designated SEQ ID:3837.

[40620] A function of VGAM1126 is therefore inhibition of Adenylate Kinase 1 (AK1, Accession NM_000476). Accordingly, utilities of VGAM1126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AK1. Alkaline Phosphatase, Intestinal (ALPI, Accession

NM_001631) is another VGAM1126 host target gene. ALPI BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ALPI, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ALPI BINDING SITE, designated SEQ ID:7342, to the nucleotide sequence of VGAM1126 RNA, herein designated VGAM RNA, also designated SEQ ID:3837.

[40621] Another function of VGAM1126 is therefore inhibition of Alkaline Phosphatase, Intestinal (ALPI, Accession NM_001631), a gene which is a glycoprotein phosphatase. Accordingly, utilities of VGAM1126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ALPI. The function of ALPI and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM885. Adaptor-related Protein Complex 2, Beta 1 Subunit (AP2B1, Accession NM_001282) is another VGAM1126 host target gene. AP2B1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AP2B1, corresponding to a HOST TARGET binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AP2B1 BINDING SITE, designated SEQ ID:6950, to the nucleotide sequence of VGAM1126 RNA, herein designated VGAM RNA, also designated SEQ ID:3837.

[40622] Another function of VGAM1126 is therefore inhibition of Adaptor-related Protein Complex 2, Beta 1 Subunit (AP2B1, Accession NM_001282), a gene which links clathrin to receptors in coated vesicles. Accordingly, utilities of VGAM1126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AP2B1. The function of AP2B1 has been established by previous studies. The beta adaptin subunit of the clathrin coat assembly complex, also referred to as AP2-beta, was cloned from human, rat and bovine cDNA libraries by Ponnambalam et al. (1990) who found that the predicted 937-amino acid proteins are totally conserved between species. The protein is part of the AP2 coat assembly protein complex (see OMIM Ref. No. 601024) and links clathrin (OMIM Ref. No. 118960) to receptors in the coated vesicles. Druck et al. (1995) used a probe from the 3-prime UTR of the human cDNA to map the gene to chromosome 17. Hybrids with portions of chromosome 17

were then used to localize CLAPB1 to 17q11.2–q12.

[40623] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[40624] Druck, T.; Gu, Y.; Prabhala. G.; Cannizzaro, L. A.; Park, S.–H.; Huebner, K.; Keen, J. H. : Chromosome localization of human genes for clathrin adaptor polypeptides AP2–beta and AP50 and the clathrin–binding protein, VCP. Genomics 30: 94–97, 1995. ; and

[40625] Ponnambalam, S.; Robinson, M. S.; Jackson, A. P.; Peiperl, L.; Parham, P. : Conservation and diversity in families of coated vesicle adaptins. J. Biol. Chem. 265: 4814–4820, 1990.

[40626] Further studies establishing the function and utilities of AP2B1 are found in John Hopkins OMIM database record ID 601025, and in cited publications numbered 9964–9965 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. ATPase, Aminophospholipid Transporter–like, Class I, Type 8A, Member 2 (ATP8A2, Accession XM_167916) is another VGAM1126 host target gene. ATP8A2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ATP8A2, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP8A2 BINDING SITE, designated SEQ ID:44917, to the nucleotide sequence of VGAM1126 RNA, herein designated VGAM RNA, also designated SEQ ID:3837.

[40627] Another function of VGAM1126 is therefore inhibition of ATPase, Aminophospholipid Transporter-like, Class I, Type 8A, Member 2 (ATP8A2, Accession XM_167916). Accordingly, utilities of VGAM1126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP8A2. AXL Receptor Tyrosine Kinase (AXL, Accession NM_021913) is another VGAM1126 host target gene. AXL BINDING SITE1 and AXL BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by AXL, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AXL BINDING SITE1 and AXL BINDING SITE2, designated SEQ ID:22441 and SEQ ID:7420 respectively, to the nucleotide sequence of VGAM1126 RNA, herein designated VGAM RNA, also designated SEQ ID:3837.

[40628] Another function of VGAM1126 is therefore inhibition of AXL Receptor Tyrosine Kinase (AXL, Accession NM_021913). Accordingly, utilities of VGAM1126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AXL. Bone Morphogenetic Protein 3 (osteogenic) (BMP3, Accession NM_001201) is another VGAM1126 host target gene. BMP3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by BMP3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BMP3 BINDING SITE, designated SEQ ID:6865, to the nucleotide sequence of VGAM1126 RNA, herein designated VGAM RNA, also designated SEQ ID:3837.

[40629] Another function of VGAM1126 is therefore inhibition of Bone Morphogenetic Protein 3 (osteogenic) (BMP3, Accession NM_001201), a gene which induces cartilage and bone formation. Accordingly, utilities of VGAM1126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BMP3. The function of BMP3 has been established by previous studies. Dickinson et al. (1990) showed that in the mouse the Bmp-3 gene is

located on chromosome 5. Arguing from homology of synteny, they suggested that the cognate gene in man is located on either chromosome 4 or chromosome 7. Indeed, using cDNA probes for the analysis of somatic cell hybrid lines, Tabas et al. (1991) assigned the BMP3 gene to 4p14–q21. BMP2A (OMIM Ref. No. 112261) and BMP3 are members of the transforming growth factor–beta supergene family; BMP1 (OMIM Ref. No. 112264) is a novel regulatory protein.

[40630] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[40631] Dickinson, M. E.; Kobrin, M. S.; Silan, C. M.; Kingsley, D. M.; Justice, M. J.; Miller, D. A.; Ceci, J. D.; Lock, L. F.; Lee, A.; Buchberg, A. M.; Siracusa, L. D.; Lyons, K. M.; Derynck, R.; Hogan, B. L. M.; Copeland, N. G.; Jenkins, N. A. : Chromosomal localization of seven members of the murine TGF–beta superfamily suggests close linkage to several morphogenetic mutant loci. *Genomics* 6: 505–520, 1990. ; and

[40632] Tabas, J. A.; Zasloff, M.; Wasmuth, J. J.; Emanuel, B. S.; Altherr, M. R.; McPherson, J. D.; Wozney, J. M.; Kaplan, F. S. : Bone morphogenetic protein: chromosomal localization of

human.

[40633] Further studies establishing the function and utilities of BMP3 are found in John Hopkins OMIM database record ID 112263, and in cited publications numbered 271 and 11629 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Corticotropin Releasing Hormone Receptor 1 (CRHR1, Accession NM_004382) is another VGAM1126 host target gene. CRHR1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CRHR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CRHR1 BINDING SITE, designated SEQ ID:10606, to the nucleotide sequence of VGAM1126 RNA, herein designated VGAM RNA, also designated SEQ ID:3837.

[40634] Another function of VGAM1126 is therefore inhibition of Corticotropin Releasing Hormone Receptor 1 (CRHR1, Accession NM_004382), a gene which likely mediates physiological and behavioral response to stress. Accordingly, utilities of VGAM1126 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with CRHR1. The function of CRHR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM435. Chemokine (C-X3-C motif) Receptor 1 (CX3CR1, Accession XM_047502) is another VGAM1126 host target gene. CX3CR1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CX3CR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CX3CR1 BINDING SITE, designated SEQ ID:34975, to the nucleotide sequence of VGAM1126 RNA, herein designated VGAM RNA, also designated SEQ ID:3837.

[40635] Another function of VGAM1126 is therefore inhibition of Chemokine (C-X3-C motif) Receptor 1 (CX3CR1, Accession XM_047502), a gene which mediates both the adhesive and migratory functions of fractalkine. Accordingly, utilities of VGAM1126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CX3CR1. The function of CX3CR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove

with reference to VGAM25.Disabled Homolog 2, Mitogen-responsive Phosphoprotein (Drosophila) (DAB2, Accession NM_001343) is another VGAM1126 host target gene.

DAB2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DAB2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DAB2 BINDING SITE, designated SEQ ID:7022, to the nucleotide sequence of VGAM1126 RNA, herein designated VGAM RNA, also designated SEQ ID:3837.

[40636] Another function of VGAM1126 is therefore inhibition of Disabled Homolog 2, Mitogen-responsive Phosphoprotein (Drosophila) (DAB2, Accession NM_001343), a gene which may be a component of the csf-1 signal transduction pathway. Accordingly, utilities of VGAM1126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DAB2. The function of DAB2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM659.EGF-like-domain, Multiple 4 (EGFL4, Accession XM_029883) is another VGAM1126 host target gene.

EGFL4 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by EGFL4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EGFL4 BINDING SITE, designated SEQ ID:30960, to the nucleotide sequence of VGAM1126 RNA, herein designated VGAM RNA, also designated SEQ ID:3837.

[40637] Another function of VGAM1126 is therefore inhibition of EGF-like-domain, Multiple 4 (EGFL4, Accession XM_029883). Accordingly, utilities of VGAM1126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EGFL4. F-box and Leucine-rich Repeat Protein 11 (FBXL11, Accession NM_012308) is another VGAM1126 host target gene. FBXL11 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FBXL11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FBXL11 BINDING SITE, designated SEQ ID:14679, to the nucleotide sequence of VGAM1126 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3837.

[40638] Another function of VGAM1126 is therefore inhibition of F-box and Leucine-rich Repeat Protein 11 (FBXL11, Accession NM_012308), a gene which are BTB/POZ domain-containing zinc finger proteins implicated in oncogenesis. Accordingly, utilities of VGAM1126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FBXL11. The function of FBXL11 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM404. Flotillin 2 (FLOT2, Accession NM_004475) is another VGAM1126 host target gene. FLOT2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLOT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLOT2 BINDING SITE, designated SEQ ID:10792, to the nucleotide sequence of VGAM1126 RNA, herein designated VGAM RNA, also designated SEQ ID:3837.

[40639] Another function of VGAM1126 is therefore inhibition of Flotillin 2 (FLOT2, Accession NM_004475), a gene which

Epidermal surface antigen (flotillin 2). Accordingly, utilities of VGAM1126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLOT2. The function of FLOT2 has been established by previous studies. Human epidermal surface antigen-1 was identified as a 35-kD antigen by means of a mouse monoclonal antibody raised against human keratinocytes. The monoclonal antibody was found to cause keratinocyte dissociation in vitro; hence, the conclusion that the native protein is involved in cell adhesion. Cho et al. (1995) found that mouse Esa cDNA encodes a 379-amino acid protein that is 99.2% identical to the human, differing at only 3 amino acids. Cho et al. (1995) found that both 'nude' and control mice have a second Esa mRNA transcript that conserves amino acid sequence and molecular mass. The mouse and human 5-prime- and 3-prime untranslated sequences are conserved. Similar RNA folding patterns of the 5-prime untranslated region are predicted despite a 91-bp insertion in the mouse. Bickel et al. (1997) found that mouse Flot2 consistently copurifies with Flot1 (OMIM Ref. No. 606998) and with caveolin-1 (OMIM Ref. No. 601047) in the purification of caveolin-rich membranes. Baumann et al. (2000) screened a yeast

2-hybrid library using the N-terminal region of CAP (OMIM Ref. No. 605264) and identified the caveolar protein flotillin. Flotillin forms a ternary complex with CAP and the CBL protooncogene product (OMIM Ref. No. 165360), directing the localization of the CAP-CBL complex to a lipid raft subdomain of the plasma membrane. Localization of the CBL-CAP complex to lipid rafts generates a pathway that is crucial in the regulation of glucose uptake. Schroeder et al. (1991) isolated a cDNA for an epidermal surface antigen believed to be involved in epidermal cell adhesion. By analysis of a somatic cell hybrid panel and in situ hybridization using the ESA cDNA, the gene was mapped to 17q11-q12 in the region containing the NF1 gene (OMIM Ref. No. 162200). Using a RFLP within the ESA1 gene, they showed tight linkage of ESA1 with NF1; maximal lod = 6.92 at theta = 0.0. By studying somatic cell hybrids carrying the 2 chromosome 17 translocations with breakpoints within the NF1 gene, t(1;17) and t(17;22), Schroeder et al. (1991) showed that the ESA1 gene is located centromeric to the t(1;17) breakpoint. It remained to be determined whether this represented another of the genes located within the NF1 gene and transcribed in the opposite direction. Kayes et al.

(1992) made that determination; physical mapping of an M17S1 cDNA on somatic cell hybrids, yeast artificial chromosomes, and DNA from an NF1 patient with a deletion involving an entire NF1 allele showed that M17S1 is located at least 180 kb centromeric to the NF1 gene. The distance between the genes suggested that M17S1 is unlikely to contribute to the NF1 phenotype. Cho et al.

(1995) mapped the mouse Esa gene to chromosome 11. Although the mouse Esa gene and the 'nude' locus map to the same region of chromosome 11, Cho et al. (1995) detected no abnormalities in protein, mRNA, cDNA or genomic Esa sequences in nude mice.

[40640] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[40641] Cho, Y.-J.; Chema, D.; Moskow, J. J.; Cho, M.; Schroeder, W. T.; Overbeek, P.; Buchberg, A. M.; Duvic, M. : Epidermal surface antigen (MS17S1) is highly conserved between mouse and human. Genomics 27: 251-258, 1995. ; and

[40642] Schroeder, W. T.; Siciliano, M. J.; Stewart-Galetka, S. L.; Duvic, M. : The human gene for an epidermal surface antigen (M17S1) is located at 17q11-12. Genomics 11: 481-482, 1991.

[40643] Further studies establishing the function and utilities of FLOT2 are found in John Hopkins OMIM database record ID 131560, and in cited publications numbered 4598–4603 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. FXYD Domain Containing Ion Transport Regulator 6 (FXYD6, Accession NM_022003) is another VGAM1126 host target gene. FXYD6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FXYD6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FXYD6 BINDING SITE, designated SEQ ID:22546, to the nucleotide sequence of VGAM1126 RNA, herein designated VGAM RNA, also designated SEQ ID:3837.

[40644] Another function of VGAM1126 is therefore inhibition of FXYD Domain Containing Ion Transport Regulator 6 (FXYD6, Accession NM_022003). Accordingly, utilities of VGAM1126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FXYD6. Growth Factor Independent 1 (GFI1, Accession NM_005263) is another VGAM1126 host target gene. GFI1

BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GFI1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GFI1 BINDING SITE, designated SEQ ID:11768, to the nucleotide sequence of VGAM1126 RNA, herein designated VGAM RNA, also designated SEQ ID:3837.

[40645] Another function of VGAM1126 is therefore inhibition of Growth Factor Independent 1 (GFI1, Accession NM_005263). Accordingly, utilities of VGAM1126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GFI1. Insulin-like Growth Factor 2 (somatomedin A) (IGF2, Accession NM_000612) is another VGAM1126 host target gene. IGF2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by IGF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IGF2 BINDING SITE, designated SEQ ID:6214, to the nucleotide sequence of VGAM1126 RNA, herein designated VGAM RNA, also designated SEQ ID:3837.

[40646] Another function of VGAM1126 is therefore inhibition of Insulin-like Growth Factor 2 (somatomedin A) (IGF2, Accession NM_000612). Accordingly, utilities of VGAM1126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IGF2. Inositol Polyphosphate-1-phosphatase (INPP1, Accession NM_002194) is another VGAM1126 host target gene. INPP1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by INPP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of INPP1 BINDING SITE, designated SEQ ID:7950, to the nucleotide sequence of VGAM1126 RNA, herein designated VGAM RNA, also designated SEQ ID:3837.

[40647] Another function of VGAM1126 is therefore inhibition of Inositol Polyphosphate-1-phosphatase (INPP1, Accession NM_002194), a gene which hydrolyzes inositol 1,3,4-trisphosphate to inositol 1,4-bisphosphate. Accordingly, utilities of VGAM1126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with INPP1. The function of INPP1 has been established by previous studies. Cells respond to extracellu-

lar stimuli through complicated networks. Phosphatidylinositol turnover plays a key role in intracellular signaling. Inositol polyphosphate 1-phosphatase, an enzyme in the phosphatidylinositol signaling pathway, catalyzes the hydrolysis of the 1 position phosphate from inositol 1,3,4-trisphosphate (Ins(1,3,4)P₃) and inositol 1,4-bisphosphate (Ins(1,4)P₂). York et al. (1993) isolated a cDNA for the human counterpart by low stringency hybridization using a cDNA encoding the bovine enzyme. The 1.74-kb human cDNA predicted a protein of 399 amino acids. The human and bovine enzymes show 84% amino acid sequence identity. Northern blot analysis of a variety of human tissues demonstrated that a 1.9-kb mRNA is ubiquitously expressed, with highest levels in pancreas and kidney. York et al. (1993) suggested INPP1 as a candidate gene for inherited psychiatric disorders that respond to lithium ions, an inhibitor of the enzyme. Woodcock et al. (2002) studied the role of inositol polyphosphates in cardiac hypertrophy, using primary cultures of neonatal rat ventricular cardiomyocytes as a model. Hypertrophy was induced by stimulating alpha-adrenergic receptors (see OMIM Ref. No. ADRA1B; 104220) or by the spontaneous contraction of dense cul-

tures. Both hypertrophy models showed increased levels of Ins(1,4)P₂ as well as the characteristic increased expression of several marker genes and increased ribosome synthesis. Transfection and overexpression of INPP1 reduced expression of hypertrophy markers and reduced the increase in ribosomal DNA transcription. Ins(1,4)P₂ levels were also increased in mouse hearts hypertrophied by pressure overload. Woodcock et al. (2002) concluded that reduced INPP1 activity may have a role in cardiac hypertrophy.

[40648] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[40649] Okabe, I.; Nussbaum, R. L. : Identification and chromosomal mapping of the mouse inositol polyphosphate 1-phosphatase gene. *Genomics* 30: 358–360, 1995. ; and

[40650] Woodcock, E. A.; Wang, B. H.; Arthur, J. F.; Lennard, A.; Matkovich, S. J.; Du, X.-J.; Brown, J. H.; Hannan, R. D. : Inositol polyphosphate 1-phosphatase is a novel antihypertrophic factor.

[40651] Further studies establishing the function and utilities of INPP1 are found in John Hopkins OMIM database record ID 147263, and in cited publications numbered 4970–4972

listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. L1 Cell Adhesion Molecule (hydrocephalus, stenosis of aqueduct of Sylvius 1, MASA (mental retardation, aphasia, shuffling gait and adducted thumbs) Syndrome, Spastic Paraplegia 1) (L1CAM, Accession NM_024003) is another VGAM1126 host target gene. L1CAM BINDING SITE1 and L1CAM BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by L1CAM, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of L1CAM BINDING SITE1 and L1CAM BINDING SITE2, designated SEQ ID:23430 and SEQ ID:6002 respectively, to the nucleotide sequence of VGAM1126 RNA, herein designated VGAM RNA, also designated SEQ ID:3837.

[40652] Another function of VGAM1126 is therefore inhibition of L1 Cell Adhesion Molecule (hydrocephalus, stenosis of aqueduct of Sylvius 1, MASA (mental retardation, aphasia, shuffling gait and adducted thumbs) Syndrome, Spastic Paraplegia 1) (L1CAM, Accession NM_024003). Accordingly, utilities of VGAM1126 include diagnosis, prevention and treatment of diseases and clinical conditions associ-

ated with L1CAM. Nerve Growth Factor Receptor (TNFR superfamily, member 16) (NGFR, Accession NM_002507) is another VGAM1126 host target gene. NGFR BINDING SITE1 and NGFR BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by NGFR, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NGFR BINDING SITE1 and NGFR BINDING SITE2, designated SEQ ID:8330 and SEQ ID:8331 respectively, to the nucleotide sequence of VGAM1126 RNA, herein designated VGAM RNA, also designated SEQ ID:3837.

[40653] Another function of VGAM1126 is therefore inhibition of Nerve Growth Factor Receptor (TNFR superfamily, member 16) (NGFR, Accession NM_002507), a gene which can mediate cell survival as well as cell death of neural cells. Accordingly, utilities of VGAM1126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NGFR. The function of NGFR and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM212. Neurexin 1 (NRXN1, Accession NM_004801) is another VGAM1126 host target

gene. NRXN1 BINDING SITE1 and NRXN1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by NRXN1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NRXN1 BINDING SITE1 and NRXN1 BINDING SITE2, designated SEQ ID:11222 and SEQ ID:26788 respectively, to the nucleotide sequence of VGAM1126 RNA, herein designated VGAM RNA, also designated SEQ ID:3837.

[40654] Another function of VGAM1126 is therefore inhibition of Neurexin 1 (NRXN1, Accession NM_004801), a gene which may be involved in cell recognition, cell adhesion, and mediate intracellular signaling. Accordingly, utilities of VGAM1126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NRXN1. The function of NRXN1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM191. Protocadherin 11 Y-linked (PCDH11Y, Accession NM_032973) is another VGAM1126 host target gene. PCDH11Y BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

PCDH11Y, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDH11Y BINDING SITE, designated SEQ ID:26822, to the nucleotide sequence of VGAM1126 RNA, herein designated VGAM RNA, also designated SEQ ID:3837.

[40655] Another function of VGAM1126 is therefore inhibition of Protocadherin 11 Y-linked (PCDH11Y, Accession NM_032973). Accordingly, utilities of VGAM1126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDH11Y. PCTAIRE Protein Kinase 3 (PCTK3, Accession XM_053746) is another VGAM1126 host target gene. PCTK3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PCTK3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCTK3 BINDING SITE, designated SEQ ID:36126, to the nucleotide sequence of VGAM1126 RNA, herein designated VGAM RNA, also designated SEQ ID:3837.

[40656] Another function of VGAM1126 is therefore inhibition of

PCTAIRE Protein Kinase 3 (PCTK3, Accession XM_053746), a gene which may play a role in signal transduction cascades in terminally differentiated cells. Accordingly, utilities of VGAM1126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCTK3. The function of PCTK3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM132. Protein Phosphatase 2, Regulatory Subunit B (B56), Beta Isoform (PPP2R5B, Accession NM_006244) is another VGAM1126 host target gene. PPP2R5B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PPP2R5B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP2R5B BINDING SITE, designated SEQ ID:12913, to the nucleotide sequence of VGAM1126 RNA, herein designated VGAM RNA, also designated SEQ ID:3837.

[40657] Another function of VGAM1126 is therefore inhibition of Protein Phosphatase 2, Regulatory Subunit B (B56), Beta Isoform (PPP2R5B, Accession NM_006244), a gene which

is a regulatory subunit of protein phosphatase 2A. Accordingly, utilities of VGAM1126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP2R5B. The function of PPP2R5B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM264. Pleckstrin Homology, Sec7 and Coiled/coil Domains 4 (PSCD4, Accession NM_013385) is another VGAM1126 host target gene. PSCD4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PSCD4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PSCD4 BINDING SITE, designated SEQ ID:15036, to the nucleotide sequence of VGAM1126 RNA, herein designated VGAM RNA, also designated SEQ ID:3837.

[40658] Another function of VGAM1126 is therefore inhibition of Pleckstrin Homology, Sec7 and Coiled/coil Domains 4 (PSCD4, Accession NM_013385), a gene which promotes guanine-nucleotide exchange on arf1 and arf5. Accordingly, utilities of VGAM1126 include diagnosis, prevention

and treatment of diseases and clinical conditions associated with PSCD4. The function of PSCD4 and its association with various diseases and clinical conditions, has been established by previous studies, as described herein above with reference to

VGAM615. Pyrroline-5-carboxylate Reductase 1 (PYCR1, Accession XM_046472) is another VGAM1126 host target gene. PYCR1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PYCR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PYCR1 BINDING SITE, designated SEQ ID:34728, to the nucleotide sequence of VGAM1126 RNA, herein designated VGAM RNA, also designated SEQ ID:3837.

[40659] Another function of VGAM1126 is therefore inhibition of Pyrroline-5-carboxylate Reductase 1 (PYCR1, Accession XM_046472), a gene which catalyzes the NAD(P)H-dependent conversion of pyrroline-5-carboxylate to proline. Accordingly, utilities of VGAM1126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PYCR1.

The function of PYCR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM178. Solute Carrier Family 2 (facilitated glucose transporter), Member 3 (SLC2A3, Accession NM_006931) is another VGAM1126 host target gene. SLC2A3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC2A3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC2A3 BINDING SITE, designated SEQ ID:13816, to the nucleotide sequence of VGAM1126 RNA, herein designated VGAM RNA, also designated SEQ ID:3837.

[40660] Another function of VGAM1126 is therefore inhibition of Solute Carrier Family 2 (facilitated glucose transporter), Member 3 (SLC2A3, Accession NM_006931), a gene which probably is a neuronal glucose transporter. Accordingly, utilities of VGAM1126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC2A3. The function of SLC2A3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove

with reference to VGAM247.SNL (Accession NM_003088) is another VGAM1126 host target gene. SNL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SNL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SNL BINDING SITE, designated SEQ ID:9059, to the nucleotide sequence of VGAM1126 RNA, herein designated VGAM RNA, also designated SEQ ID:3837.

[40661] Another function of VGAM1126 is therefore inhibition of SNL (Accession NM_003088), a gene which organizes filamentous actin into bundles with a minimum of 4.1:1 actin/fascin ratio. Accordingly, utilities of VGAM1126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNL. The function of SNL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM675.Transforming Growth Factor, Beta 3 (TGFB3, Accession NM_003239) is another VGAM1126 host target gene. TGFB3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

TGFB3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TGFB3 BINDING SITE, designated SEQ ID:9233, to the nucleotide sequence of VGAM1126 RNA, herein designated VGAM RNA, also designated SEQ ID:3837.

[40662] Another function of VGAM1126 is therefore inhibition of Transforming Growth Factor, Beta 3 (TGFB3, Accession NM_003239), a gene which is involved in embryogenesis and cell differentiation. Accordingly, utilities of VGAM1126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TGFB3. The function of TGFB3 has been established by previous studies. Type beta transforming growth factors are polypeptides that act hormonally to control the proliferation and differentiation of multiple cell types. A cDNA clone for a third form of TGFB was isolated by ten Dijke et al. (1988). The C-terminal 112 amino acids of TGF-beta-3 share approximately 80% sequence identity with beta-1 (OMIM Ref. No. 190180) and beta-2 (OMIM Ref. No. 190220). By Southern analysis of DNA prepared from somatic cell hybrids and by in situ hybridization, ten Dijke et

al. (1988) assigned the TGFB3 gene to 14q23–q24. Barton et al. (1988) likewise assigned the TGFB3 gene to chromosome 14 and regionalized it to 14q24 by Southern blot analysis of hybrid cell DNAs and by in situ hybridization. The homologous gene in the mouse, Tsfb–3, was mapped to chromosome 12 (Barton et al., 1988; Dickinson et al., 1990). Graycar et al. (1989) purified to apparent homogeneity human TGFB3 and evaluated its activities in comparison to TGFB1 and TGFB2. Lee and Nowak (2001) compared expression of the TGFB isoforms in normal myometrium and benign leiomyoma tumors of the uterus (OMIM Ref. No. 150699) and examined the effects of TGFBs on cell proliferation and collagen production by these cells in vitro. Northern blot analysis showed that the levels of TGFB1 mRNA were similar between leiomyoma and myometrium, whereas leiomyoma showed 5-fold higher levels of expression of TGFB3 mRNA than autologous myometrium. Expression of TGFB3 protein detected by immunohistochemistry was much more intense in leiomyoma tissues than in corresponding myometrium. The authors concluded that their results support the hypothesis that alterations in the TGFB system produce loss of sensitivity to the antiproliferative effects of TGFB, and

increased expression of TGFB3 may contribute to the growth of these tumors. Animal model experiments lend further support to the function of TGFB3. Proetzel et al. (1995) produced Tgfb3-null mice in which exon 6 of the Tgfb3 gene was replaced by the neomycin-resistance gene. Whereas heterozygotes had no apparent phenotypic change, homozygotes had an incompletely penetrant failure of the palatal shelves to fuse, leading to cleft palate. The defect appeared to result from impaired adhesion of the apposing medial edge epithelial of the palatal shelves and subsequent elimination of the midline epithelial seam. No craniofacial abnormalities were observed. Defective palatogenesis was also found in homozygous Tgfb3-null mutant mice by Kaartinen et al. (1995) who also found a consistent delay in pulmonary development. They suggested that the study demonstrates an essential function for TGF-beta-3 in normal palate and lung morphogenesis and implicates this cytokine in epithelial-mesenchymal interaction.

[40663] It is appreciated that the abovementioned animal model for TGFB3 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[40664] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[40665] Graycar, J. L.; Miller, D. A.; Arrick, B. A.; Lyons, R. M.; Moses, H. L.; Derynck, R. : Human transforming growth factor-beta-3: recombinant expression, purification, and biological activities in comparison with transforming growth factors-beta-1 and beta-2. *Molec. Endocr.* 3: 1977-1986, 1989. ; and

[40666] Proetzel, G.; Pawlowski, S. A.; Wiles, M. V.; Yin, M.; Boivin, G. P.; Howles, P. N.; Ding, J.; Ferguson, M. W. J.; Doetschman, T. : Transforming growth factor-beta-3 is required for seco.

[40667] Further studies establishing the function and utilities of TGFB3 are found in John Hopkins OMIM database record ID 190230, and in cited publications numbered 1235 and 5953-5959 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Toll-like Receptor 5 (TLR5, Accession NM_003268) is another VGAM1126 host target gene. TLR5 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by TLR5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TLR5 BINDING SITE, designated SEQ ID:9276, to the nucleotide sequence of VGAM1126 RNA, herein designated VGAM RNA, also designated SEQ ID:3837.

[40668] Another function of VGAM1126 is therefore inhibition of Toll-like Receptor 5 (TLR5, Accession NM_003268), a gene which participates in the innate immune response to bacterial flagellins. Accordingly, utilities of VGAM1126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TLR5. The function of TLR5 has been established by previous studies. By searching an EST database for human Toll homologs, Chaudhary et al. (1998) identified cDNA sequences from 2 genes that they called TIL3 and TIL4 (TLR2; 603028). Muzio et al. (2000) determined the differential expression pattern of the TLRs in leukocytes. Like TLR2 and TLR4, TLR5 was expressed in myelomonocytic cells, but at lower levels. Hayashi et al. (2001) showed that expression of TLR5 induces NF-kappa-B activation and TNFA (OMIM Ref. No. 191160) production. Pathogen-associated molecular patterns (PAMPs) known to stimulate other TLR family members failed to stimulate TLR5; however, luciferase reporter

assays indicated TLR5 activation in gram-positive and -negative bacterial culture supernatants. By fractionation of *Listeria* culture supernatants followed by SDS-PAGE, Hayashi et al. (2001) identified flagellin as the TLR5 ligand. Flagellin, a principal component of bacterial flagella, is a virulence factor recognized by the innate immune system in plants, insects, and mammals. Expression of flagellin in nonflagellated bacteria resulted in TLR5 activation, and deletion of flagellin from flagellated bacteria abrogated TLR5 activation. Hayashi et al. (2001) demonstrated that injection of flagellin induces the production of IL6 (OMIM Ref. No. 147620) in wildtype mice, but not in those lacking the MyD88 (OMIM Ref. No. 602170) adaptor protein, required for TLR signaling. Hayashi et al. (2001) concluded that TLR5 is a pattern-recognition receptor and that its PAMP is flagellin, a protein with conserved N and C termini in a broad group of motile pathogens.

[40669] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[40670] Chaudhary, P. M.; Ferguson, C.; Nguyen, V.; Nguyen, O.; Massa, H. F.; Eby, M.; Jasmin, A.; Trask, B. J.; Hood, L.; Nelson, P. S. : Cloning and characterization of two Toll/

interleukin-1 receptor-like genes TIL3 and TIL4: evidence for a multi-gene receptor family in humans. Blood 91: 4020-4027, 1998. ; and

[40671] Hayashi, F.; Smith, K. D.; Ozinsky, A.; Hawn, T. R.; Yi, E. C.; Goodlett, D. R.; Eng, J. K.; Akira, S.; Underhill, D. M.; Aderem, A. : The innate immune response to bacterial flagellin.

[40672] Further studies establishing the function and utilities of TLR5 are found in John Hopkins OMIM database record ID 603031, and in cited publications numbered 7953, 673 and 9837-9838 listed in the bibliography section herein-below, which are also hereby incorporated by reference. Ubiquitination Factor E4A (UFD2 homolog, yeast) (UBE4A, Accession NM_004788) is another VGAM1126 host target gene. UBE4A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by UBE4A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UBE4A BINDING SITE, designated SEQ ID:11195, to the nucleotide sequence of VGAM1126 RNA, herein designated VGAM RNA, also designated SEQ ID:3837.

[40673] Another function of VGAM1126 is therefore inhibition of Ubiquitination Factor E4A (UFD2 homolog, yeast) (UBE4A, Accession NM_004788), a gene which binds to the ubiquitin moieties of preformed conjugates and catalyzes ubiquitin chain assembly in conjunction with E1, E2, and E3. Accordingly, utilities of VGAM1126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBE4A. The function of UBE4A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM60. ABLIM (Accession NM_002313) is another VGAM1126 host target gene. ABLIM BINDING SITE1 and ABLIM BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ABLIM, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ABLIM BINDING SITE1 and ABLIM BINDING SITE2, designated SEQ ID:8110 and SEQ ID:13543 respectively, to the nucleotide sequence of VGAM1126 RNA, herein designated VGAM RNA, also designated SEQ ID:3837.

[40674] Another function of VGAM1126 is therefore inhibition of

ABLIM (Accession NM_002313). Accordingly, utilities of VGAM1126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABLIM. Calneuron 1 (CALN1, Accession NM_031468) is another VGAM1126 host target gene. CALN1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CALN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CALN1 BINDING SITE, designated SEQ ID:25512, to the nucleotide sequence of VGAM1126 RNA, herein designated VGAM RNA, also designated SEQ ID:3837.

[40675] Another function of VGAM1126 is therefore inhibition of Calneuron 1 (CALN1, Accession NM_031468). Accordingly, utilities of VGAM1126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CALN1. Chloride Intracellular Channel 2 (CLIC2, Accession NM_001289) is another VGAM1126 host target gene. CLIC2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CLIC2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Ta-

ble 2 illustrates the complementarity of the nucleotide sequences of CLIC2 BINDING SITE, designated SEQ ID:6966, to the nucleotide sequence of VGAM1126 RNA, herein designated VGAM RNA, also designated SEQ ID:3837.

[40676] Another function of VGAM1126 is therefore inhibition of Chloride Intracellular Channel 2 (CLIC2, Accession NM_001289). Accordingly, utilities of VGAM1126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLIC2. Calsyntenin 2 (CLSTN2, Accession NM_022131) is another VGAM1126 host target gene. CLSTN2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CLSTN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLSTN2 BINDING SITE, designated SEQ ID:22695, to the nucleotide sequence of VGAM1126 RNA, herein designated VGAM RNA, also designated SEQ ID:3837.

[40677] Another function of VGAM1126 is therefore inhibition of Calsyntenin 2 (CLSTN2, Accession NM_022131). Accordingly, utilities of VGAM1126 include diagnosis, prevention and treatment of diseases and clinical conditions associ-

ated with CLSTN2. D15Wsu75e (Accession XM_039495) is another VGAM1126 host target gene. D15Wsu75e BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by D15Wsu75e, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of D15Wsu75e BINDING SITE, designated SEQ ID:33100, to the nucleotide sequence of VGAM1126 RNA, herein designated VGAM RNA, also designated SEQ ID:3837.

[40678] Another function of VGAM1126 is therefore inhibition of D15Wsu75e (Accession XM_039495). Accordingly, utilities of VGAM1126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with D15Wsu75e. DKFZP564L2423 (Accession XM_031015) is another VGAM1126 host target gene. DKFZP564L2423 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP564L2423, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564L2423 BINDING SITE, designated SEQ ID:31258, to the nucleotide sequence of

VGAM1126 RNA, herein designated VGAM RNA, also designated SEQ ID:3837.

[40679] Another function of VGAM1126 is therefore inhibition of DKFZP564L2423 (Accession XM_031015). Accordingly, utilities of VGAM1126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564L2423. DKFZp761G0313 (Accession XM_038026) is another VGAM1126 host target gene. DKFZp761G0313 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp761G0313, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp761G0313 BINDING SITE, designated SEQ ID:32739, to the nucleotide sequence of VGAM1126 RNA, herein designated VGAM RNA, also designated SEQ ID:3837.

[40680] Another function of VGAM1126 is therefore inhibition of DKFZp761G0313 (Accession XM_038026). Accordingly, utilities of VGAM1126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761G0313. Fer-1-like 4 (C. elegans) (FER1L4, Accession NM_025206) is another VGAM1126 host target

gene. FER1L4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FER1L4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FER1L4 BINDING SITE, designated SEQ ID:24872, to the nucleotide sequence of VGAM1126 RNA, herein designated VGAM RNA, also designated SEQ ID:3837.

[40681] Another function of VGAM1126 is therefore inhibition of Fer-1-like 4 (*C. elegans*) (FER1L4, Accession NM_025206). Accordingly, utilities of VGAM1126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FER1L4. FLJ11000 (Accession NM_018295) is another VGAM1126 host target gene. FLJ11000 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ11000, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11000 BINDING SITE, designated SEQ ID:20284, to the nucleotide sequence of VGAM1126 RNA, herein designated VGAM RNA, also designated SEQ

ID:3837.

[40682] Another function of VGAM1126 is therefore inhibition of FLJ11000 (Accession NM_018295). Accordingly, utilities of VGAM1126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11000. FLJ12294 (Accession NM_025100) is another VGAM1126 host target gene. FLJ12294 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ12294, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12294 BINDING SITE, designated SEQ ID:24742, to the nucleotide sequence of VGAM1126 RNA, herein designated VGAM RNA, also designated SEQ ID:3837.

[40683] Another function of VGAM1126 is therefore inhibition of FLJ12294 (Accession NM_025100). Accordingly, utilities of VGAM1126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12294. FLJ12595 (Accession NM_024994) is another VGAM1126 host target gene. FLJ12595 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ12595, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12595 BINDING SITE, designated SEQ ID:24557, to the nucleotide sequence of VGAM1126 RNA, herein designated VGAM RNA, also designated SEQ ID:3837.

[40684] Another function of VGAM1126 is therefore inhibition of FLJ12595 (Accession NM_024994). Accordingly, utilities of VGAM1126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12595. FLJ13204 (Accession NM_024761) is another VGAM1126 host target gene. FLJ13204 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13204, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13204 BINDING SITE, designated SEQ ID:24113, to the nucleotide sequence of VGAM1126 RNA, herein designated VGAM RNA, also designated SEQ ID:3837.

[40685] Another function of VGAM1126 is therefore inhibition of FLJ13204 (Accession NM_024761). Accordingly, utilities of VGAM1126 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ13204. FLJ13391 (Accession NM_032181) is another VGAM1126 host target gene. FLJ13391 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ13391, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13391 BINDING SITE, designated SEQ ID:25894, to the nucleotide sequence of VGAM1126 RNA, herein designated VGAM RNA, also designated SEQ ID:3837.

[40686] Another function of VGAM1126 is therefore inhibition of FLJ13391 (Accession NM_032181). Accordingly, utilities of VGAM1126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13391. FLJ13881 (Accession NM_024729) is another VGAM1126 host target gene. FLJ13881 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ13881, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13881 BINDING SITE, designated SEQ ID:24065, to the nucleotide

sequence of VGAM1126 RNA, herein designated VGAM RNA, also designated SEQ ID:3837.

[40687] Another function of VGAM1126 is therefore inhibition of FLJ13881 (Accession NM_024729). Accordingly, utilities of VGAM1126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13881. FLJ20128 (Accession NM_017679) is another VGAM1126 host target gene. FLJ20128 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ20128, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20128 BINDING SITE, designated SEQ ID:19222, to the nucleotide sequence of VGAM1126 RNA, herein designated VGAM RNA, also designated SEQ ID:3837.

[40688] Another function of VGAM1126 is therefore inhibition of FLJ20128 (Accession NM_017679). Accordingly, utilities of VGAM1126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20128. FLJ20489 (Accession NM_017842) is another VGAM1126 host target gene. FLJ20489 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by FLJ20489, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20489 BINDING SITE, designated SEQ ID:19506, to the nucleotide sequence of VGAM1126 RNA, herein designated VGAM RNA, also designated SEQ ID:3837.

[40689] Another function of VGAM1126 is therefore inhibition of FLJ20489 (Accession NM_017842). Accordingly, utilities of VGAM1126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20489. FLJ22169 (Accession NM_024085) is another VGAM1126 host target gene. FLJ22169 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22169, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22169 BINDING SITE, designated SEQ ID:23520, to the nucleotide sequence of VGAM1126 RNA, herein designated VGAM RNA, also designated SEQ ID:3837.

[40690] Another function of VGAM1126 is therefore inhibition of FLJ22169 (Accession NM_024085). Accordingly, utilities of

VGAM1126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22169. FLJ30663 (Accession XM_086046) is another VGAM1126 host target gene. FLJ30663 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ30663, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ30663 BINDING SITE, designated SEQ ID:38461, to the nucleotide sequence of VGAM1126 RNA, herein designated VGAM RNA, also designated SEQ ID:3837.

[40691] Another function of VGAM1126 is therefore inhibition of FLJ30663 (Accession XM_086046). Accordingly, utilities of VGAM1126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ30663. Glycoprotein V (platelet) (GP5, Accession NM_004488) is another VGAM1126 host target gene. GP5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GP5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

GP5 BINDING SITE, designated SEQ ID:10816, to the nucleotide sequence of VGAM1126 RNA, herein designated VGAM RNA, also designated SEQ ID:3837.

[40692] Another function of VGAM1126 is therefore inhibition of Glycoprotein V (platelet) (GP5, Accession NM_004488). Accordingly, utilities of VGAM1126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GP5. HCCA2 (Accession XM_039894) is another VGAM1126 host target gene. HCCA2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by HCCA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HCCA2 BINDING SITE, designated SEQ ID:33202, to the nucleotide sequence of VGAM1126 RNA, herein designated VGAM RNA, also designated SEQ ID:3837.

[40693] Another function of VGAM1126 is therefore inhibition of HCCA2 (Accession XM_039894). Accordingly, utilities of VGAM1126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HCCA2. KIAA0237 (Accession NM_014747) is another VGAM1126 host target gene. KIAA0237 BINDING SITE is HOST TARGET

binding site found in the 3' untranslated region of mRNA encoded by KIAA0237, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0237 BINDING SITE, designated SEQ ID:16439, to the nucleotide sequence of VGAM1126 RNA, herein designated VGAM RNA, also designated SEQ ID:3837.

[40694] Another function of VGAM1126 is therefore inhibition of KIAA0237 (Accession NM_014747). Accordingly, utilities of VGAM1126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0237. KIAA0285 (Accession NM_014807) is another VGAM1126 host target gene. KIAA0285 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0285, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0285 BINDING SITE, designated SEQ ID:16749, to the nucleotide sequence of VGAM1126 RNA, herein designated VGAM RNA, also designated SEQ ID:3837.

[40695] Another function of VGAM1126 is therefore inhibition of

KIAA0285 (Accession NM_014807). Accordingly, utilities of VGAM1126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0285. KIAA0397 (Accession XM_029438) is another VGAM1126 host target gene. KIAA0397 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0397, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0397 BINDING SITE, designated SEQ ID:30894, to the nucleotide sequence of VGAM1126 RNA, herein designated VGAM RNA, also designated SEQ ID:3837.

[40696] Another function of VGAM1126 is therefore inhibition of KIAA0397 (Accession XM_029438). Accordingly, utilities of VGAM1126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0397. KIAA0427 (Accession NM_014772) is another VGAM1126 host target gene. KIAA0427 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0427, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA0427 BINDING SITE, designated SEQ ID:16572, to the nucleotide sequence of VGAM1126 RNA, herein designated VGAM RNA, also designated SEQ ID:3837.

[40697] Another function of VGAM1126 is therefore inhibition of KIAA0427 (Accession NM_014772). Accordingly, utilities of VGAM1126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0427. KIAA0471 (Accession NM_014857) is another VGAM1126 host target gene. KIAA0471 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0471, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0471 BINDING SITE, designated SEQ ID:16908, to the nucleotide sequence of VGAM1126 RNA, herein designated VGAM RNA, also designated SEQ ID:3837.

[40698] Another function of VGAM1126 is therefore inhibition of KIAA0471 (Accession NM_014857). Accordingly, utilities of VGAM1126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0471. KIAA0481 (Accession XM_050144) is another

VGAM1126 host target gene. KIAA0481 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0481, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0481 BINDING SITE, designated SEQ ID:35567, to the nucleotide sequence of VGAM1126 RNA, herein designated VGAM RNA, also designated SEQ ID:3837.

[40699] Another function of VGAM1126 is therefore inhibition of KIAA0481 (Accession XM_050144). Accordingly, utilities of VGAM1126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0481. KIAA0563 (Accession NM_014834) is another VGAM1126 host target gene. KIAA0563 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0563, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0563 BINDING SITE, designated SEQ ID:16839, to the nucleotide sequence of VGAM1126 RNA, herein designated VGAM RNA, also designated SEQ ID:3837.

[40700] Another function of VGAM1126 is therefore inhibition of KIAA0563 (Accession NM_014834). Accordingly, utilities of VGAM1126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0563. KIAA0978 (Accession XM_047013) is another VGAM1126 host target gene. KIAA0978 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0978, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0978 BINDING SITE, designated SEQ ID:34886, to the nucleotide sequence of VGAM1126 RNA, herein designated VGAM RNA, also designated SEQ ID:3837.

[40701] Another function of VGAM1126 is therefore inhibition of KIAA0978 (Accession XM_047013). Accordingly, utilities of VGAM1126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0978. KIAA1465 (Accession XM_027396) is another VGAM1126 host target gene. KIAA1465 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1465, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1465 BINDING SITE, designated SEQ ID:30500, to the nucleotide sequence of VGAM1126 RNA, herein designated VGAM RNA, also designated SEQ ID:3837.

[40702] Another function of VGAM1126 is therefore inhibition of KIAA1465 (Accession XM_027396). Accordingly, utilities of VGAM1126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1465. KIAA1554 (Accession XM_170834) is another VGAM1126 host target gene. KIAA1554 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1554, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1554 BINDING SITE, designated SEQ ID:45608, to the nucleotide sequence of VGAM1126 RNA, herein designated VGAM RNA, also designated SEQ ID:3837.

[40703] Another function of VGAM1126 is therefore inhibition of KIAA1554 (Accession XM_170834). Accordingly, utilities of VGAM1126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA1554. KIAA1727 (Accession XM_034262) is another VGAM1126 host target gene. KIAA1727 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1727, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1727 BINDING SITE, designated SEQ ID:32032, to the nucleotide sequence of VGAM1126 RNA, herein designated VGAM RNA, also designated SEQ ID:3837.

[40704] Another function of VGAM1126 is therefore inhibition of KIAA1727 (Accession XM_034262). Accordingly, utilities of VGAM1126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1727. KIAA1909 (Accession XM_057996) is another VGAM1126 host target gene. KIAA1909 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1909, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1909 BINDING SITE, designated SEQ ID:36557, to the nucleotide sequence of VGAM1126 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3837.

[40705] Another function of VGAM1126 is therefore inhibition of KIAA1909 (Accession XM_057996). Accordingly, utilities of VGAM1126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1909. KIAA1944 (Accession XM_062545) is another VGAM1126 host target gene. KIAA1944 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1944, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1944 BINDING SITE, designated SEQ ID:37226, to the nucleotide sequence of VGAM1126 RNA, herein designated VGAM RNA, also designated SEQ ID:3837.

[40706] Another function of VGAM1126 is therefore inhibition of KIAA1944 (Accession XM_062545). Accordingly, utilities of VGAM1126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1944. MGC1136 (Accession NM_024025) is another VGAM1126 host target gene. MGC1136 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC1136, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC1136 BINDING SITE, designated SEQ ID:23452, to the nucleotide sequence of VGAM1126 RNA, herein designated VGAM RNA, also designated SEQ ID:3837.

[40707] Another function of VGAM1126 is therefore inhibition of MGC1136 (Accession NM_024025). Accordingly, utilities of VGAM1126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC1136. MGC13170 (Accession NM_032712) is another VGAM1126 host target gene. MGC13170 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC13170, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC13170 BINDING SITE, designated SEQ ID:26430, to the nucleotide sequence of VGAM1126 RNA, herein designated VGAM RNA, also designated SEQ ID:3837.

[40708] Another function of VGAM1126 is therefore inhibition of MGC13170 (Accession NM_032712). Accordingly, utilities of VGAM1126 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with MGC13170. MGC17998 (Accession NM_144997) is another VGAM1126 host target gene. MGC17998 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC17998, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC17998 BINDING SITE, designated SEQ ID:29602, to the nucleotide sequence of VGAM1126 RNA, herein designated VGAM RNA, also designated SEQ ID:3837.

[40709] Another function of VGAM1126 is therefore inhibition of MGC17998 (Accession NM_144997). Accordingly, utilities of VGAM1126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC17998. Mitochondrial Ribosomal Protein L20 (MRPL20, Accession NM_017971) is another VGAM1126 host target gene. MRPL20 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MRPL20, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MRPL20 BINDING SITE,

designated SEQ ID:19695, to the nucleotide sequence of VGAM1126 RNA, herein designated VGAM RNA, also designated SEQ ID:3837.

[40710] Another function of VGAM1126 is therefore inhibition of Mitochondrial Ribosomal Protein L20 (MRPL20, Accession NM_017971). Accordingly, utilities of VGAM1126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MRPL20. Opiate Receptor-like 1 (OPRL1, Accession NM_000913) is another VGAM1126 host target gene. OPRL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by OPRL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OPRL1 BINDING SITE, designated SEQ ID:6614, to the nucleotide sequence of VGAM1126 RNA, herein designated VGAM RNA, also designated SEQ ID:3837.

[40711] Another function of VGAM1126 is therefore inhibition of Opiate Receptor-like 1 (OPRL1, Accession NM_000913). Accordingly, utilities of VGAM1126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OPRL1. PDZ Domain Containing 2

(PDZD2, Accession XM_087705) is another VGAM1126 host target gene. PDZD2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PDZD2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDZD2 BINDING SITE, designated SEQ ID:39389, to the nucleotide sequence of VGAM1126 RNA, herein designated VGAM RNA, also designated SEQ ID:3837.

[40712] Another function of VGAM1126 is therefore inhibition of PDZ Domain Containing 2 (PDZD2, Accession XM_087705). Accordingly, utilities of VGAM1126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDZD2. PME-1 (Accession NM_016147) is another VGAM1126 host target gene. PME-1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PME-1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PME-1 BINDING SITE, designated SEQ ID:18232, to the nucleotide sequence of VGAM1126 RNA,

herein designated VGAM RNA, also designated SEQ ID:3837.

[40713] Another function of VGAM1126 is therefore inhibition of PME-1 (Accession NM_016147). Accordingly, utilities of VGAM1126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PME-1. PRO0132 (Accession NM_014116) is another VGAM1126 host target gene. PRO0132 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PRO0132, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO0132 BINDING SITE, designated SEQ ID:15368, to the nucleotide sequence of VGAM1126 RNA, herein designated VGAM RNA, also designated SEQ ID:3837.

[40714] Another function of VGAM1126 is therefore inhibition of PRO0132 (Accession NM_014116). Accordingly, utilities of VGAM1126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO0132. Syndecan 3 (N-syndecan) (SDC3, Accession NM_014654) is another VGAM1126 host target gene. SDC3 BINDING SITE is HOST TARGET binding site found in

the 3' untranslated region of mRNA encoded by SDC3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SDC3 BINDING SITE, designated SEQ ID:16088, to the nucleotide sequence of VGAM1126 RNA, herein designated VGAM RNA, also designated SEQ ID:3837.

[40715] Another function of VGAM1126 is therefore inhibition of Syndecan 3 (N-syndecan) (SDC3, Accession NM_014654). Accordingly, utilities of VGAM1126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SDC3. SEP15 (Accession NM_004261) is another VGAM1126 host target gene. SEP15 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SEP15, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEP15 BINDING SITE, designated SEQ ID:10453, to the nucleotide sequence of VGAM1126 RNA, herein designated VGAM RNA, also designated SEQ ID:3837.

[40716] Another function of VGAM1126 is therefore inhibition of

SEP15 (Accession NM_004261). Accordingly, utilities of VGAM1126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEP15. Sideroflexin 5 (SFXN5, Accession NM_144579) is another VGAM1126 host target gene. SFXN5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SFXN5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SFXN5 BINDING SITE, designated SEQ ID:29384, to the nucleotide sequence of VGAM1126 RNA, herein designated VGAM RNA, also designated SEQ ID:3837.

[40717] Another function of VGAM1126 is therefore inhibition of Sideroflexin 5 (SFXN5, Accession NM_144579). Accordingly, utilities of VGAM1126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SFXN5. SKIP (Accession NM_130766) is another VGAM1126 host target gene. SKIP BINDING SITE1 and SKIP BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by SKIP, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of SKIP BINDING SITE1 and SKIP BINDING SITE2, designated SEQ ID:28260 and SEQ ID:18597 respectively, to the nucleotide sequence of VGAM1126 RNA, herein designated VGAM RNA, also designated SEQ ID:3837.

[40718] Another function of VGAM1126 is therefore inhibition of SKIP (Accession NM_130766). Accordingly, utilities of VGAM1126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SKIP. SMC1 Structural Maintenance of Chromosomes 1-like 1 (yeast) (SMC1L1, Accession XM_050403) is another VGAM1126 host target gene. SMC1L1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SMC1L1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SMC1L1 BINDING SITE, designated SEQ ID:35617, to the nucleotide sequence of VGAM1126 RNA, herein designated VGAM RNA, also designated SEQ ID:3837.

[40719] Another function of VGAM1126 is therefore inhibition of SMC1 Structural Maintenance of Chromosomes 1-like 1 (yeast) (SMC1L1, Accession XM_050403). Accordingly,

utilities of VGAM1126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMC1L1. Smith–Magenis Syndrome Chromosome Region, Candidate 5 (SMCR5, Accession NM_144774) is another VGAM1126 host target gene. SMCR5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SMCR5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SMCR5 BINDING SITE, designated SEQ ID:29561, to the nucleotide sequence of VGAM1126 RNA, herein designated VGAM RNA, also designated SEQ ID:3837.

[40720] Another function of VGAM1126 is therefore inhibition of Smith–Magenis Syndrome Chromosome Region, Candidate 5 (SMCR5, Accession NM_144774). Accordingly, utilities of VGAM1126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMCR5. Syntaphilin (SNPH, Accession NM_014723) is another VGAM1126 host target gene. SNPH BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SNPH, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SNPH BINDING SITE, designated SEQ ID:16289, to the nucleotide sequence of VGAM1126 RNA, herein designated VGAM RNA, also designated SEQ ID:3837.

[40721] Another function of VGAM1126 is therefore inhibition of Syntaphilin (SNPH, Accession NM_014723). Accordingly, utilities of VGAM1126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNPH. Signal Transducer and Activator of Transcription 5A (STAT5A, Accession NM_003152) is another VGAM1126 host target gene. STAT5A BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by STAT5A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STAT5A BINDING SITE, designated SEQ ID:9126, to the nucleotide sequence of VGAM1126 RNA, herein designated VGAM RNA, also designated SEQ ID:3837.

[40722] Another function of VGAM1126 is therefore inhibition of Signal Transducer and Activator of Transcription 5A (STAT5A, Accession NM_003152). Accordingly, utilities of

VGAM1126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STAT5A. Synaptotagmin XII (SYT12, Accession XM_170657) is another VGAM1126 host target gene. SYT12 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by SYT12, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SYT12 BINDING SITE, designated SEQ ID:45429, to the nucleotide sequence of VGAM1126 RNA, herein designated VGAM RNA, also designated SEQ ID:3837.

[40723] Another function of VGAM1126 is therefore inhibition of Synaptotagmin XII (SYT12, Accession XM_170657). Accordingly, utilities of VGAM1126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SYT12. Zinc Finger Protein 91 Homolog (mouse) (ZFP91, Accession NM_053023) is another VGAM1126 host target gene. ZFP91 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZFP91, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZFP91 BINDING SITE, designated SEQ ID:27572, to the nucleotide sequence of VGAM1126 RNA, herein designated VGAM RNA, also designated SEQ ID:3837.

[40724] Another function of VGAM1126 is therefore inhibition of Zinc Finger Protein 91 Homolog (mouse) (ZFP91, Accession NM_053023). Accordingly, utilities of VGAM1126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZFP91. LOC116071 (Accession NM_138456) is another VGAM1126 host target gene. LOC116071 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC116071, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC116071 BINDING SITE, designated SEQ ID:28815, to the nucleotide sequence of VGAM1126 RNA, herein designated VGAM RNA, also designated SEQ ID:3837.

[40725] Another function of VGAM1126 is therefore inhibition of LOC116071 (Accession NM_138456). Accordingly, utilities of VGAM1126 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC116071. LOC118738 (Accession XM_061125) is another VGAM1126 host target gene. LOC118738 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC118738, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC118738 BINDING SITE, designated SEQ ID:37194, to the nucleotide sequence of VGAM1126 RNA, herein designated VGAM RNA, also designated SEQ ID:3837.

[40726] Another function of VGAM1126 is therefore inhibition of LOC118738 (Accession XM_061125). Accordingly, utilities of VGAM1126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC118738. LOC127702 (Accession XM_060619) is another VGAM1126 host target gene. LOC127702 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC127702, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC127702 BINDING SITE, designated SEQ ID:37179, to

the nucleotide sequence of VGAM1126 RNA, herein designated VGAM RNA, also designated SEQ ID:3837.

[40727] Another function of VGAM1126 is therefore inhibition of LOC127702 (Accession XM_060619). Accordingly, utilities of VGAM1126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC127702. LOC130644 (Accession XM_065813) is another VGAM1126 host target gene. LOC130644 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC130644, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC130644 BINDING SITE, designated SEQ ID:37304, to the nucleotide sequence of VGAM1126 RNA, herein designated VGAM RNA, also designated SEQ ID:3837.

[40728] Another function of VGAM1126 is therefore inhibition of LOC130644 (Accession XM_065813). Accordingly, utilities of VGAM1126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC130644. LOC132166 (Accession XM_059574) is another VGAM1126 host target gene. LOC132166 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC132166, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC132166 BINDING SITE, designated SEQ ID:37020, to the nucleotide sequence of VGAM1126 RNA, herein designated VGAM RNA, also designated SEQ ID:3837.

[40729] Another function of VGAM1126 is therefore inhibition of LOC132166 (Accession XM_059574). Accordingly, utilities of VGAM1126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC132166. LOC145761 (Accession XM_096855) is another VGAM1126 host target gene. LOC145761 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC145761, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145761 BINDING SITE, designated SEQ ID:40582, to the nucleotide sequence of VGAM1126 RNA, herein designated VGAM RNA, also designated SEQ ID:3837.

[40730] Another function of VGAM1126 is therefore inhibition of LOC145761 (Accession XM_096855). Accordingly, utilities

of VGAM1126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145761. LOC145989 (Accession XM_004815) is another VGAM1126 host target gene. LOC145989 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145989, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145989 BINDING SITE, designated SEQ ID:29947, to the nucleotide sequence of VGAM1126 RNA, herein designated VGAM RNA, also designated SEQ ID:3837.

[40731] Another function of VGAM1126 is therefore inhibition of LOC145989 (Accession XM_004815). Accordingly, utilities of VGAM1126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145989. LOC147071 (Accession XM_054031) is another VGAM1126 host target gene. LOC147071 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC147071, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC147071 BINDING SITE, designated SEQ ID:36132, to the nucleotide sequence of VGAM1126 RNA, herein designated VGAM RNA, also designated SEQ ID:3837.

[40732] Another function of VGAM1126 is therefore inhibition of LOC147071 (Accession XM_054031). Accordingly, utilities of VGAM1126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147071. LOC148894 (Accession XM_097542) is another VGAM1126 host target gene. LOC148894 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC148894, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148894 BINDING SITE, designated SEQ ID:40917, to the nucleotide sequence of VGAM1126 RNA, herein designated VGAM RNA, also designated SEQ ID:3837.

[40733] Another function of VGAM1126 is therefore inhibition of LOC148894 (Accession XM_097542). Accordingly, utilities of VGAM1126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148894. LOC151068 (Accession XM_098000) is another VGAM1126 host target gene. LOC151068 BINDING

SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC151068, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151068 BINDING SITE, designated SEQ ID:41296, to the nucleotide sequence of VGAM1126 RNA, herein designated VGAM RNA, also designated SEQ ID:3837.

[40734] Another function of VGAM1126 is therefore inhibition of LOC151068 (Accession XM_098000). Accordingly, utilities of VGAM1126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151068. LOC152286 (Accession XM_098188) is another VGAM1126 host target gene. LOC152286 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152286, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152286 BINDING SITE, designated SEQ ID:41461, to the nucleotide sequence of VGAM1126 RNA, herein designated VGAM RNA, also designated SEQ ID:3837.

[40735] Another function of VGAM1126 is therefore inhibition of

LOC152286 (Accession XM_098188). Accordingly, utilities of VGAM1126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152286. LOC152915 (Accession XM_040172) is another VGAM1126 host target gene. LOC152915 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC152915, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152915 BINDING SITE, designated SEQ ID:33268, to the nucleotide sequence of VGAM1126 RNA, herein designated VGAM RNA, also designated SEQ ID:3837.

[40736] Another function of VGAM1126 is therefore inhibition of LOC152915 (Accession XM_040172). Accordingly, utilities of VGAM1126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152915. LOC153338 (Accession XM_098361) is another VGAM1126 host target gene. LOC153338 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC153338, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC153338 BINDING SITE, designated SEQ ID:41608, to the nucleotide sequence of VGAM1126 RNA, herein designated VGAM RNA, also designated SEQ ID:3837.

[40737] Another function of VGAM1126 is therefore inhibition of LOC153338 (Accession XM_098361). Accordingly, utilities of VGAM1126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153338. LOC158230 (Accession XM_088517) is another VGAM1126 host target gene. LOC158230 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC158230, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158230 BINDING SITE, designated SEQ ID:39766, to the nucleotide sequence of VGAM1126 RNA, herein designated VGAM RNA, also designated SEQ ID:3837.

[40738] Another function of VGAM1126 is therefore inhibition of LOC158230 (Accession XM_088517). Accordingly, utilities of VGAM1126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158230. LOC158969 (Accession XM_088728) is an-

other VGAM1126 host target gene. LOC158969 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC158969, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158969 BINDING SITE, designated SEQ ID:39919, to the nucleotide sequence of VGAM1126 RNA, herein designated VGAM RNA, also designated SEQ ID:3837.

[40739] Another function of VGAM1126 is therefore inhibition of LOC158969 (Accession XM_088728). Accordingly, utilities of VGAM1126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158969. LOC200982 (Accession XM_117305) is another VGAM1126 host target gene. LOC200982 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC200982, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200982 BINDING SITE, designated SEQ ID:43372, to the nucleotide sequence of VGAM1126 RNA, herein designated VGAM RNA, also designated SEQ ID:3837.

[40740] Another function of VGAM1126 is therefore inhibition of LOC200982 (Accession XM_117305). Accordingly, utilities of VGAM1126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200982. LOC201173 (Accession XM_113312) is another VGAM1126 host target gene. LOC201173 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC201173, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201173 BINDING SITE, designated SEQ ID:42211, to the nucleotide sequence of VGAM1126 RNA, herein designated VGAM RNA, also designated SEQ ID:3837.

[40741] Another function of VGAM1126 is therefore inhibition of LOC201173 (Accession XM_113312). Accordingly, utilities of VGAM1126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201173. LOC201220 (Accession XM_113321) is another VGAM1126 host target gene. LOC201220 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC201220, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201220 BINDING SITE, designated SEQ ID:42219, to the nucleotide sequence of VGAM1126 RNA, herein designated VGAM RNA, also designated SEQ ID:3837.

[40742] Another function of VGAM1126 is therefore inhibition of LOC201220 (Accession XM_113321). Accordingly, utilities of VGAM1126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201220. LOC201229 (Accession XM_113925) is another VGAM1126 host target gene. LOC201229 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC201229, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201229 BINDING SITE, designated SEQ ID:42542, to the nucleotide sequence of VGAM1126 RNA, herein designated VGAM RNA, also designated SEQ ID:3837.

[40743] Another function of VGAM1126 is therefore inhibition of LOC201229 (Accession XM_113925). Accordingly, utilities of VGAM1126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC201229. LOC203197 (Accession XM_114645) is another VGAM1126 host target gene. LOC203197 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC203197, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203197 BINDING SITE, designated SEQ ID:43009, to the nucleotide sequence of VGAM1126 RNA, herein designated VGAM RNA, also designated SEQ ID:3837.

[40744] Another function of VGAM1126 is therefore inhibition of LOC203197 (Accession XM_114645). Accordingly, utilities of VGAM1126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203197. LOC205693 (Accession XM_120345) is another VGAM1126 host target gene. LOC205693 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC205693, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC205693 BINDING SITE, designated SEQ ID:43608, to the nucleotide sequence of VGAM1126 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3837.

[40745] Another function of VGAM1126 is therefore inhibition of LOC205693 (Accession XM_120345). Accordingly, utilities of VGAM1126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC205693. LOC220766 (Accession XM_165471) is another VGAM1126 host target gene. LOC220766 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC220766, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220766 BINDING SITE, designated SEQ ID:43647, to the nucleotide sequence of VGAM1126 RNA, herein designated VGAM RNA, also designated SEQ ID:3837.

[40746] Another function of VGAM1126 is therefore inhibition of LOC220766 (Accession XM_165471). Accordingly, utilities of VGAM1126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220766. LOC221463 (Accession XM_166374) is another VGAM1126 host target gene. LOC221463 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221463, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221463 BINDING SITE, designated SEQ ID:44200, to the nucleotide sequence of VGAM1126 RNA, herein designated VGAM RNA, also designated SEQ ID:3837.

[40747] Another function of VGAM1126 is therefore inhibition of LOC221463 (Accession XM_166374). Accordingly, utilities of VGAM1126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221463. LOC223073 (Accession XM_170293) is another VGAM1126 host target gene. LOC223073 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC223073, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC223073 BINDING SITE, designated SEQ ID:45316, to the nucleotide sequence of VGAM1126 RNA, herein designated VGAM RNA, also designated SEQ ID:3837.

[40748] Another function of VGAM1126 is therefore inhibition of LOC223073 (Accession XM_170293). Accordingly, utilities of VGAM1126 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC223073. LOC257054 (Accession XM_171010) is another VGAM1126 host target gene. LOC257054 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC257054, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257054 BINDING SITE, designated SEQ ID:45780, to the nucleotide sequence of VGAM1126 RNA, herein designated VGAM RNA, also designated SEQ ID:3837.

[40749] Another function of VGAM1126 is therefore inhibition of LOC257054 (Accession XM_171010). Accordingly, utilities of VGAM1126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257054. LOC51236 (Accession NM_016458) is another VGAM1126 host target gene. LOC51236 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC51236, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51236 BINDING SITE, designated SEQ ID:18570, to the

nucleotide sequence of VGAM1126 RNA, herein designated VGAM RNA, also designated SEQ ID:3837.

[40750] Another function of VGAM1126 is therefore inhibition of LOC51236 (Accession NM_016458). Accordingly, utilities of VGAM1126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51236. LOC51308 (Accession NM_016606) is another VGAM1126 host target gene. LOC51308 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51308, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51308 BINDING SITE, designated SEQ ID:18707, to the nucleotide sequence of VGAM1126 RNA, herein designated VGAM RNA, also designated SEQ ID:3837.

[40751] Another function of VGAM1126 is therefore inhibition of LOC51308 (Accession NM_016606). Accordingly, utilities of VGAM1126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51308. LOC56961 (Accession XM_031857) is another VGAM1126 host target gene. LOC56961 BINDING SITE is HOST TARGET binding site found in the 5' untranslated

region of mRNA encoded by LOC56961, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC56961 BINDING SITE, designated SEQ ID:31505, to the nucleotide sequence of VGAM1126 RNA, herein designated VGAM RNA, also designated SEQ ID:3837.

[40752] Another function of VGAM1126 is therefore inhibition of LOC56961 (Accession XM_031857). Accordingly, utilities of VGAM1126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC56961. LOC91373 (Accession XM_038063) is another VGAM1126 host target gene. LOC91373 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91373, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91373 BINDING SITE, designated SEQ ID:32751, to the nucleotide sequence of VGAM1126 RNA, herein designated VGAM RNA, also designated SEQ ID:3837.

[40753] Another function of VGAM1126 is therefore inhibition of LOC91373 (Accession XM_038063). Accordingly, utilities

of VGAM1126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91373. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1127 (VGAM1127) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[40754] VGAM1127 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1127 was detected is described hereinabove with reference to Figs. 1-8.

[40755] VGAM1127 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Barley Stripe Mosaic Virus. VGAM1127 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[40756] VGAM1127 gene encodes a VGAM1127 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1127 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nu-

cleotide sequence of VGAM1127 precursor RNA is designated SEQ ID:1113, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1113 is located at position 1512 relative to the genome of Barley Stripe Mosaic Virus.

[40757] VGAM1127 precursor RNA folds onto itself, forming VGAM1127 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[40758] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1127 folded precursor RNA into VGAM1127 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 59%) nucleotide sequence of VGAM1127 RNA is designated SEQ ID:3838, and

is provided hereinbelow with reference to the sequence listing part.

[40759] VGAM1127 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1127 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1127 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[40760] VGAM1127 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1127 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1127 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing – VGAM1127 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1127 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[40761] The complementary binding of VGAM1127 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1127 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1127 host target RNA into VGAM1127 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[40762] It is appreciated that VGAM1127 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1127 host target genes. The mRNA of each one of this plurality of VGAM1127 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM1127 RNA, herein designated VGAM RNA, and which when bound by VGAM1127 RNA causes inhibition of translation of respective one or more VGAM1127 host target proteins.

[40763] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1127 gene, herein designated VGAM GENE, on one or more VGAM1127 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[40764] It is yet further appreciated that a function of VGAM1127 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1127 include diagnosis, prevention and treatment of viral infection by Barley Stripe Mosaic Virus. Specific functions, and accordingly utilities, of VGAM1127 correlate with, and may be deduced from, the identity of the host target genes which VGAM1127 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[40765] Nucleotide sequences of the VGAM1127 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1127 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1127 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1127 are further described hereinbelow with reference to Table 1.

[40766] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1127 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1127 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[40767] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM1127 gene, herein designated VGAM is inhibition of expression of VGAM1127 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1127 correlate with, and may be deduced from, the identity of the target genes which VGAM1127 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[40768] Coronin, Actin Binding Protein, 2A (CORO2A, Accession NM_052820) is a VGAM1127 host target gene. CORO2A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CORO2A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CORO2A BINDING SITE, designated SEQ ID:27408, to the nucleotide sequence of VGAM1127 RNA, herein designated VGAM RNA, also designated SEQ ID:3838.

[40769] A function of VGAM1127 is therefore inhibition of Coronin, Actin Binding Protein, 2A (CORO2A, Accession NM_052820). Accordingly, utilities of VGAM1127 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CORO2A. Fibulin 5 (FBLN5,

Accession NM_006329) is another VGAM1127 host target gene. FBLN5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FBLN5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FBLN5 BINDING SITE, designated SEQ ID:13021, to the nucleotide sequence of VGAM1127 RNA, herein designated VGAM RNA, also designated SEQ ID:3838.

[40770] Another function of VGAM1127 is therefore inhibition of Fibulin 5 (FBLN5, Accession NM_006329), a gene which promotes adhesion of endothelial cells through interaction of integrins and the rgd motif. Accordingly, utilities of VGAM1127 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FBLN5. The function of FBLN5 has been established by previous studies. In sequence analysis of mouse fibulin-1 (FBLN1; 135820), Pan et al. (1993) obtained several similar cDNA clones that suggested the existence of a second isoform. Detailed study of the sequence predicted a novel and longer protein, fibulin-2. The protein predicted from the cDNA obtained from a mouse fibroblast library consisted

of a 1,195-residue polypeptide preceded by a 26-residue signal peptide. Except for 2 additional EGF-like repeats, the COOH-terminal region showed 43% sequence identity with fibulin-1. The NH₂-terminal 408 residues, unique to fibulin-2, showed no sequence homology to other known proteins and presumably formed 2 additional domains that differ in their cysteine content. Recombinant fibulin-2 was produced and secreted by human cell clones as a disulfide-bonded trimer. No significant immunologic cross-reactivity could be detected between fibulin-1 and fibulin-2. Production of fibulin-2 was demonstrated by Northern blots and radioimmunoassay in fibroblasts but not in several tumor cell lines. Together with the observation that the serum level of fibulin-2 is 1,000-fold lower than that of fibulin-1, the data indicated that the 2 isoforms are not always coordinately expressed. Zhang et al. (1994) isolated and sequenced a 4.1-kb human fibulin-2 cDNA, which encoded a mature protein of 1,157 amino acids preceded by a 27-residue signal sequence. The predicted polypeptide was found to contain 3 consecutive anaphylatoxin-related segments (domain I) in its central region followed by 10 EGF-like repeats (domain II), 9 of which had a consensus sequence for calcium binding. The

amino acid sequences of human and mouse fibulin-2 shared approximately 90% identity in 3 domains but only 62% in another. Northern blot analysis of mRNA from various human tissues revealed an abundant 4.5-kb transcript in heart, placenta, and ovary tissue. The expression pattern differed from that of fibulin-1. By isotopic in situ hybridization, Zhang et al. (1994) mapped the FBLN2 gene to 3p25-p24 in the human and to chromosome 6 in the D-E region in the mouse. Using 2 polymorphisms in the FBLN2 gene, Collod et al. (1996) excluded FBLN2 as the site of the mutation causing type II Marfan syndrome (OMIM Ref. No. 154705), which maps to the same region of 3p. Using conformation-sensitive gel electrophoresis and direct sequencing of PCR products to screen for mutations in the cDNA for FBLN2, Kuivaniemi et al. (1998) studied 11 patients with abdominal aortic aneurysms and 2 controls. They found a total of 14 single-base sequence variations but these did not segregate with abdominal aortic aneurysms in families.

[40771] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[40772] Collod, G.; Chu, M.-L.; Sasaki, T.; Coulon, M.; Timpl, R.;

Renkart, L.; Weissenbach, J.; Jondeau, G.; Bourdarias, J. P.; Junien, C.; Boileau, C. : Fibulin-2: genetic mapping and exclusion as a candidate gene in Marfan syndrome type 2. *Europ. J. Hum. Genet.* 4: 292-295, 1996. ; and

[40773] Kuivaniemi, H.; Marshall, A.; Ganguly, A.; Chu, M.-L.; Abbott, W. M.; Tromp, G. : Fibulin-2 exhibits high degree of variability, but no structural changes concordant with abdominal aort.

[40774] Further studies establishing the function and utilities of FBLN5 are found in John Hopkins OMIM database record ID 604580, and in cited publications numbered 4937-4940 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Phosphatidylinositol Glycan, Class A (paroxysmal nocturnal hemoglobinuria) (PIGA, Accession NM_020472) is another VGAM1127 host target gene. PIGA BINDING SITE1 through PIGA BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PIGA, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PIGA BINDING SITE1 through PIGA BINDING SITE3, designated SEQ ID:21708, SEQ ID:8497

and SEQ ID:21715 respectively, to the nucleotide sequence of VGAM1127 RNA, herein designated VGAM RNA, also designated SEQ ID:3838.

[40775] Another function of VGAM1127 is therefore inhibition of Phosphatidylinositol Glycan, Class A (paroxysmal nocturnal hemoglobinuria) (PIGA, Accession NM_020472). Accordingly, utilities of VGAM1127 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIGA. Apolipoprotein L, 2 (APOL2, Accession NM_030882) is another VGAM1127 host target gene. APOL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by APOL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of APOL2 BINDING SITE, designated SEQ ID:25159, to the nucleotide sequence of VGAM1127 RNA, herein designated VGAM RNA, also designated SEQ ID:3838.

[40776] Another function of VGAM1127 is therefore inhibition of Apolipoprotein L, 2 (APOL2, Accession NM_030882). Accordingly, utilities of VGAM1127 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APOL2. JDD1 (Accession XM_032515) is another VGAM1127 host target gene. JDD1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by JDD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of JDD1 BINDING SITE, designated SEQ ID:31668, to the nucleotide sequence of VGAM1127 RNA, herein designated VGAM RNA, also designated SEQ ID:3838.

[40777] Another function of VGAM1127 is therefore inhibition of JDD1 (Accession XM_032515). Accordingly, utilities of VGAM1127 include diagnosis, prevention and treatment of diseases and clinical conditions associated with JDD1. Mab-21-like 2 (C. elegans) (MAB21L2, Accession NM_006439) is another VGAM1127 host target gene. MAB21L2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MAB21L2, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAB21L2 BINDING SITE, designated SEQ ID:13152, to the nucleotide sequence of VGAM1127 RNA, herein designated VGAM RNA, also designated SEQ ID:3838.

[40778] Another function of VGAM1127 is therefore inhibition of Mab-21-like 2 (*C. elegans*) (MAB21L2, Accession NM_006439). Accordingly, utilities of VGAM1127 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAB21L2. LOC254413 (Accession XM_173141) is another VGAM1127 host target gene. LOC254413 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC254413, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254413 BINDING SITE, designated SEQ ID:46398, to the nucleotide sequence of VGAM1127 RNA, herein designated VGAM RNA, also designated SEQ ID:3838.

[40779] Another function of VGAM1127 is therefore inhibition of LOC254413 (Accession XM_173141). Accordingly, utilities

of VGAM1127 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254413. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1128 (VGAM1128) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[40780] VGAM1128 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1128 was detected is described hereinabove with reference to Figs. 1-8.

[40781] VGAM1128 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Barley Stripe Mosaic Virus. VGAM1128 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[40782] VGAM1128 gene encodes a VGAM1128 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1128 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nu-

cleotide sequence of VGAM1128 precursor RNA is designated SEQ ID:1114, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1114 is located at position 2166 relative to the genome of Barley Stripe Mosaic Virus.

[40783] VGAM1128 precursor RNA folds onto itself, forming VGAM1128 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[40784] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1128 folded precursor RNA into VGAM1128 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 53%) nucleotide sequence of VGAM1128 RNA is designated SEQ ID:3839, and

is provided hereinbelow with reference to the sequence listing part.

[40785] VGAM1128 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1128 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1128 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[40786] VGAM1128 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1128 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1128 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing – VGAM1128 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1128 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[40787] The complementary binding of VGAM1128 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1128 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1128 host target RNA into VGAM1128 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[40788] It is appreciated that VGAM1128 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1128 host target genes. The mRNA of each one of this plurality of VGAM1128 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com–

plementary to VGAM1128 RNA, herein designated VGAM RNA, and which when bound by VGAM1128 RNA causes inhibition of translation of respective one or more VGAM1128 host target proteins.

[40789] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1128 gene, herein designated VGAM GENE, on one or more VGAM1128 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[40790] It is yet further appreciated that a function of VGAM1128 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1128 include diagnosis, prevention and treatment of viral infection by Barley Stripe Mosaic Virus. Specific functions, and accordingly utilities, of VGAM1128 correlate with, and may be deduced from, the identity of the host target genes which VGAM1128 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[40791] Nucleotide sequences of the VGAM1128 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1128 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1128 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1128 are further described hereinbelow with reference to Table 1.

[40792] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1128 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1128 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[40793] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM1128 gene, herein designated VGAM is inhibition of expression of VGAM1128 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1128 correlate with, and may be deduced from, the identity of the target genes which VGAM1128 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[40794] Cadherin, EGF LAG Seven-pass G-type Receptor 2 (flamingo homolog, Drosophila) (CELSR2, Accession NM_001408) is a VGAM1128 host target gene. CELSR2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CELSR2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CELSR2 BINDING SITE, designated SEQ ID:7105, to the nucleotide sequence of VGAM1128 RNA, herein designated VGAM RNA, also designated SEQ ID:3839.

[40795] A function of VGAM1128 is therefore inhibition of Cadherin, EGF LAG Seven-pass G-type Receptor 2 (flamingo homolog, Drosophila) (CELSR2, Accession NM_001408), a gene which is a calcium dependent cell adhesion protein. Accordingly, utilities of VGAM1128 include diagnosis,

prevention and treatment of diseases and clinical conditions associated with CELSR2. The function of CELSR2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM432. Leptin (obesity homolog, mouse) (LEP, Accession NM_000230) is another VGAM1128 host target gene. LEP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LEP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LEP BINDING SITE, designated SEQ ID:5736, to the nucleotide sequence of VGAM1128 RNA, herein designated VGAM RNA, also designated SEQ ID:3839.

[40796] Another function of VGAM1128 is therefore inhibition of Leptin (obesity homolog, mouse) (LEP, Accession NM_000230). Accordingly, utilities of VGAM1128 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LEP. Transcription Factor 3 (E2A immunoglobulin enhancer binding factors E12/E47) (TCF3, Accession XM_047600) is another VGAM1128 host target gene. TCF3 BINDING SITE is HOST TARGET binding

site found in the 3` untranslated region of mRNA encoded by TCF3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TCF3 BINDING SITE, designated SEQ ID:35008, to the nucleotide sequence of VGAM1128 RNA, herein designated VGAM RNA, also designated SEQ ID:3839.

[40797] Another function of VGAM1128 is therefore inhibition of Transcription Factor 3 (E2A immunoglobulin enhancer binding factors E12/E47) (TCF3, Accession XM_047600), a gene which plays major roles in determining tissue-specific cell fate during embryogenesis. Accordingly, utilities of VGAM1128 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TCF3. The function of TCF3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM144. Chromosome 20 Open Reading Frame 162 (C20orf162, Accession NM_080603) is another VGAM1128 host target gene. C20orf162 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by C20orf162, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf162 BINDING SITE, designated SEQ ID:27921, to the nucleotide sequence of VGAM1128 RNA, herein designated VGAM RNA, also designated SEQ ID:3839.

[40798] Another function of VGAM1128 is therefore inhibition of Chromosome 20 Open Reading Frame 162 (C20orf162, Accession NM_080603). Accordingly, utilities of VGAM1128 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf162. DKFZp434K1210 (Accession NM_017606) is another VGAM1128 host target gene. DKFZp434K1210 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp434K1210, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp434K1210 BINDING SITE, designated SEQ ID:19100, to the nucleotide sequence of VGAM1128 RNA, herein designated VGAM RNA, also designated SEQ ID:3839.

[40799] Another function of VGAM1128 is therefore inhibition of

DKFZp434K1210 (Accession NM_017606). Accordingly, utilities of VGAM1128 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434K1210. FLJ10737 (Accession NM_018198) is another VGAM1128 host target gene. FLJ10737 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10737, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10737 BINDING SITE, designated SEQ ID:20063, to the nucleotide sequence of VGAM1128 RNA, herein designated VGAM RNA, also designated SEQ ID:3839.

[40800] Another function of VGAM1128 is therefore inhibition of FLJ10737 (Accession NM_018198). Accordingly, utilities of VGAM1128 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10737. FLJ10956 (Accession NM_018283) is another VGAM1128 host target gene. FLJ10956 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10956, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of FLJ10956 BINDING SITE, designated SEQ ID:20277, to the nucleotide sequence of VGAM1128 RNA, herein designated VGAM RNA, also designated SEQ ID:3839.

[40801] Another function of VGAM1128 is therefore inhibition of FLJ10956 (Accession NM_018283). Accordingly, utilities of VGAM1128 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10956. Glutamine-fructose-6-phosphate Transaminase 1 (GFPT1, Accession NM_002056) is another VGAM1128 host target gene. GFPT1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GFPT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GFPT1 BINDING SITE, designated SEQ ID:7819, to the nucleotide sequence of VGAM1128 RNA, herein designated VGAM RNA, also designated SEQ ID:3839.

[40802] Another function of VGAM1128 is therefore inhibition of Glutamine-fructose-6-phosphate Transaminase 1 (GFPT1, Accession NM_002056). Accordingly, utilities of VGAM1128 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with GFPT1. G Protein-coupled Receptor Kinase-interactor 2 (GIT2, Accession NM_014776) is another VGAM1128 host target gene. GIT2 BINDING SITE1 through GIT2 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by GIT2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GIT2 BINDING SITE1 through GIT2 BINDING SITE3, designated SEQ ID:16597, SEQ ID:27692 and SEQ ID:27679 respectively, to the nucleotide sequence of VGAM1128 RNA, herein designated VGAM RNA, also designated SEQ ID:3839.

[40803] Another function of VGAM1128 is therefore inhibition of G Protein-coupled Receptor Kinase-interactor 2 (GIT2, Accession NM_014776). Accordingly, utilities of VGAM1128 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GIT2. MGC13198 (Accession NM_032690) is another VGAM1128 host target gene. MGC13198 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MGC13198, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING

SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC13198 BINDING SITE, designated SEQ ID:26410, to the nucleotide sequence of VGAM1128 RNA, herein designated VGAM RNA, also designated SEQ ID:3839.

[40804] Another function of VGAM1128 is therefore inhibition of MGC13198 (Accession NM_032690). Accordingly, utilities of VGAM1128 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC13198. SPEC1 (Accession NM_020239) is another VGAM1128 host target gene. SPEC1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SPEC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SPEC1 BINDING SITE, designated SEQ ID:21507, to the nucleotide sequence of VGAM1128 RNA, herein designated VGAM RNA, also designated SEQ ID:3839.

[40805] Another function of VGAM1128 is therefore inhibition of SPEC1 (Accession NM_020239). Accordingly, utilities of VGAM1128 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SPEC1.

LOC146819 (Accession XM_085605) is another VGAM1128 host target gene. LOC146819 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146819, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146819 BINDING SITE, designated SEQ ID:38253, to the nucleotide sequence of VGAM1128 RNA, herein designated VGAM RNA, also designated SEQ ID:3839.

[40806] Another function of VGAM1128 is therefore inhibition of LOC146819 (Accession XM_085605). Accordingly, utilities of VGAM1128 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146819. LOC146821 (Accession XM_085597) is another VGAM1128 host target gene. LOC146821 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146821, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146821 BINDING SITE, designated SEQ ID:38251, to the nucleotide sequence of VGAM1128 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3839.

[40807] Another function of VGAM1128 is therefore inhibition of LOC146821 (Accession XM_085597). Accordingly, utilities of VGAM1128 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146821. LOC153218 (Accession XM_087628) is another VGAM1128 host target gene. LOC153218 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC153218, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153218 BINDING SITE, designated SEQ ID:39364, to the nucleotide sequence of VGAM1128 RNA, herein designated VGAM RNA, also designated SEQ ID:3839.

[40808] Another function of VGAM1128 is therefore inhibition of LOC153218 (Accession XM_087628). Accordingly, utilities of VGAM1128 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153218. LOC253187 (Accession XM_173139) is another VGAM1128 host target gene. LOC253187 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC253187, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253187 BINDING SITE, designated SEQ ID:46393, to the nucleotide sequence of VGAM1128 RNA, herein designated VGAM RNA, also designated SEQ ID:3839.

[40809] Another function of VGAM1128 is therefore inhibition of LOC253187 (Accession XM_173139). Accordingly, utilities of VGAM1128 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253187. LOC253613 (Accession XM_171225) is another VGAM1128 host target gene. LOC253613 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC253613, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253613 BINDING SITE, designated SEQ ID:46006, to the nucleotide sequence of VGAM1128 RNA, herein designated VGAM RNA, also designated SEQ ID:3839.

[40810] Another function of VGAM1128 is therefore inhibition of LOC253613 (Accession XM_171225). Accordingly, utilities of VGAM1128 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC253613. LOC54466 (Accession NM_019003) is another VGAM1128 host target gene. LOC54466 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC54466, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC54466 BINDING SITE, designated SEQ ID:21075, to the nucleotide sequence of VGAM1128 RNA, herein designated VGAM RNA, also designated SEQ ID:3839.

[40811] Another function of VGAM1128 is therefore inhibition of LOC54466 (Accession NM_019003). Accordingly, utilities of VGAM1128 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC54466. LOC91963 (Accession XM_041902) is another VGAM1128 host target gene. LOC91963 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC91963, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91963 BINDING SITE, designated SEQ ID:33628, to the

nucleotide sequence of VGAM1128 RNA, herein designated VGAM RNA, also designated SEQ ID:3839.

[40812] Another function of VGAM1128 is therefore inhibition of LOC91963 (Accession XM_041902). Accordingly, utilities of VGAM1128 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91963. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1129 (VGAM1129) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[40813] VGAM1129 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1129 was detected is described hereinabove with reference to Figs. 1–8.

[40814] VGAM1129 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Barley Stripe Mosaic Virus. VGAM1129 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[40815] VGAM1129 gene encodes a VGAM1129 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1129 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1129 precursor RNA is designated SEQ ID:1115, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1115 is located at position 2771 relative to the genome of Barley Stripe Mosaic Virus.

[40816] VGAM1129 precursor RNA folds onto itself, forming VGAM1129 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[40817] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1129 folded precursor RNA into VGAM1129 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1129 RNA is designated SEQ ID:3840, and is provided hereinbelow with reference to the sequence listing part.

[40818] VGAM1129 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1129 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1129 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[40819] VGAM1129 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1129 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1129 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1129 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1129 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[40820] The complementary binding of VGAM1129 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1129 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1129 host target RNA into VGAM1129 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[40821] It is appreciated that VGAM1129 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM1129 host target genes. The mRNA of each one of this plurality of VGAM1129 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1129 RNA, herein designated VGAM RNA, and which when bound by VGAM1129 RNA causes inhibition of translation of respective one or more VGAM1129 host target proteins.

[40822] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1129 gene, herein designated VGAM GENE, on one or more VGAM1129 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science
294,779 (2001)).

[40823] It is yet further appreciated that a function of VGAM1129 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1129 include diagnosis, prevention and treatment of viral infection by Barley Stripe Mosaic Virus. Specific functions, and accordingly utilities, of VGAM1129 correlate with, and may be deduced from, the identity of the host target genes which VGAM1129 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[40824] Nucleotide sequences of the VGAM1129 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1129 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1129 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1129 are further described hereinbelow with reference to Table 1.

[40825] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1129 host target RNA, and schematic representation of the complementarity of each

of these host target binding sites to VGAM1129 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[40826] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1129 gene, herein designated VGAM is inhibition of expression of VGAM1129 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1129 correlate with, and may be deduced from, the identity of the target genes which VGAM1129 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[40827] Dystroglycan 1 (dystrophin-associated glycoprotein 1) (DAG1, Accession NM_004393) is a VGAM1129 host target gene. DAG1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DAG1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DAG1 BINDING SITE, designated SEQ ID:10633, to the nucleotide sequence of VGAM1129 RNA, herein designated VGAM RNA, also designated SEQ ID:3840.

[40828] A function of VGAM1129 is therefore inhibition of Dystroglycan 1 (dystrophin-associated glycoprotein 1) (DAG1,

Accession NM_004393), a gene which may provide linkage between the sarcolemma and extracellular matrix (ECM). Accordingly, utilities of VGAM1129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DAG1. The function of DAG1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1095.ATPase, (Na⁺)/K⁺ Transporting, Beta 4 Polypeptide (ATP1B4, Accession NM_012069) is another VGAM1129 host target gene. ATP1B4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ATP1B4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP1B4 BINDING SITE, designated SEQ ID:14327, to the nucleotide sequence of VGAM1129 RNA, herein designated VGAM RNA, also designated SEQ ID:3840.

[40829] Another function of VGAM1129 is therefore inhibition of ATPase, (Na⁺)/K⁺ Transporting, Beta 4 Polypeptide (ATP1B4, Accession NM_012069). Accordingly, utilities of VGAM1129 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with ATP1B4. DKFZP564C196 (Accession XM_046405) is another VGAM1129 host target gene. DKFZP564C196 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP564C196, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564C196 BINDING SITE, designated SEQ ID:34712, to the nucleotide sequence of VGAM1129 RNA, herein designated VGAM RNA, also designated SEQ ID:3840.

[40830] Another function of VGAM1129 is therefore inhibition of DKFZP564C196 (Accession XM_046405). Accordingly, utilities of VGAM1129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564C196. PP1057 (Accession NM_031285) is another VGAM1129 host target gene. PP1057 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PP1057, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

PP1057 BINDING SITE, designated SEQ ID:25311, to the nucleotide sequence of VGAM1129 RNA, herein designated VGAM RNA, also designated SEQ ID:3840.

[40831] Another function of VGAM1129 is therefore inhibition of PP1057 (Accession NM_031285). Accordingly, utilities of VGAM1129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PP1057. LOC143920 (Accession XM_084658) is another VGAM1129 host target gene. LOC143920 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC143920, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143920 BINDING SITE, designated SEQ ID:37642, to the nucleotide sequence of VGAM1129 RNA, herein designated VGAM RNA, also designated SEQ ID:3840.

[40832] Another function of VGAM1129 is therefore inhibition of LOC143920 (Accession XM_084658). Accordingly, utilities of VGAM1129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143920. LOC154881 (Accession XM_088063) is another VGAM1129 host target gene. LOC154881 BINDING

SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC154881, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154881 BINDING SITE, designated SEQ ID:39499, to the nucleotide sequence of VGAM1129 RNA, herein designated VGAM RNA, also designated SEQ ID:3840.

[40833] Another function of VGAM1129 is therefore inhibition of LOC154881 (Accession XM_088063). Accordingly, utilities of VGAM1129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154881. LOC255152 (Accession XM_173310) is another VGAM1129 host target gene. LOC255152 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC255152, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255152 BINDING SITE, designated SEQ ID:46534, to the nucleotide sequence of VGAM1129 RNA, herein designated VGAM RNA, also designated SEQ ID:3840.

[40834] Another function of VGAM1129 is therefore inhibition of

LOC255152 (Accession XM_173310). Accordingly, utilities of VGAM1129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255152. LOC255481 (Accession XM_170489) is another VGAM1129 host target gene. LOC255481 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC255481, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255481 BINDING SITE, designated SEQ ID:45330, to the nucleotide sequence of VGAM1129 RNA, herein designated VGAM RNA, also designated SEQ ID:3840.

[40835] Another function of VGAM1129 is therefore inhibition of LOC255481 (Accession XM_170489). Accordingly, utilities of VGAM1129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255481. LOC91301 (Accession XM_037564) is another VGAM1129 host target gene. LOC91301 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC91301, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of LOC91301 BINDING SITE, designated SEQ ID:32648, to the nucleotide sequence of VGAM1129 RNA, herein designated VGAM RNA, also designated SEQ ID:3840.

[40836] Another function of VGAM1129 is therefore inhibition of LOC91301 (Accession XM_037564). Accordingly, utilities of VGAM1129 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91301. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1130 (VGAM1130) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[40837] VGAM1130 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1130 was detected is described hereinabove with reference to Figs. 1–8.

[40838] VGAM1130 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Barley Stripe Mosaic Virus. VGAM1130 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in

the human genome.

[40839] VGAM1130 gene encodes a VGAM1130 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1130 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1130 precursor RNA is designated SEQ ID:1116, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1116 is located at position 3018 relative to the genome of Barley Stripe Mosaic Virus.

[40840] VGAM1130 precursor RNA folds onto itself, forming VGAM1130 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[40841] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1130 folded precursor RNA into VGAM1130 RNA, herein designated VGAM RNA, a single stranded ~22

nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM1130 RNA is designated SEQ ID:3841, and is provided hereinbelow with reference to the sequence listing part.

[40842] VGAM1130 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1130 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1130 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[40843] VGAM1130 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1130 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1130 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1130 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1130 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[40844] The complementary binding of VGAM1130 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1130 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1130 host target RNA into VGAM1130 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[40845] It is appreciated that VGAM1130 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1130 host target genes. The mRNA of each one of this plurality of VGAM1130 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1130 RNA, herein designated VGAM RNA, and which when bound by VGAM1130 RNA causes inhibition of translation of respective one or more VGAM1130 host target proteins.

[40846] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1130 gene, herein designated VGAM GENE, on one or more VGAM1130 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[40847] It is yet further appreciated that a function of VGAM1130 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1130 include diagnosis, prevention and treatment of viral infection by Barley Stripe Mosaic Virus. Specific functions, and accordingly utilities, of VGAM1130 correlate with, and may be deduced from, the identity of the host target genes which VGAM1130 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[40848] Nucleotide sequences of the VGAM1130 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1130 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1130 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1130 are further described hereinbelow with reference to Table 1.

[40849] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM1130 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1130 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[40850] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1130 gene, herein designated VGAM is inhibition of expression of VGAM1130 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1130 correlate with, and may be deduced from, the identity of the target genes which VGAM1130 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[40851] NDRG Family Member 2 (NDRG2, Accession NM_016250) is a VGAM1130 host target gene. NDRG2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NDRG2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NDRG2 BINDING SITE, designated SEQ ID:18378, to the nucleotide sequence of VGAM1130 RNA, herein designated VGAM RNA, also designated SEQ ID:3841.

[40852] A function of VGAM1130 is therefore inhibition of NDRG Family Member 2 (NDRG2, Accession NM_016250), a gene which belongs to the ndrg family. Accordingly, utilities of VGAM1130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NDRG2. The function of NDRG2 has been established by previous studies. Van Belzen et al. (1997) and Piquemal et al. (1999) demonstrated the existence of an Ndr gene family in mouse and human. Using the novel mouse sequences of Ndr2 and Ndr3 to search the human genome databases, Kalaydjieva et al. (2000) identified the homologous human genes, which they referred as NDRG2 and NDRG3 (OMIM Ref. No. 605273). Kalaydjieva et al. (2000) stated that the 3 known human NDRG proteins show considerable homology: 54% amino acid sequence identity between NDRG1 (OMIM Ref. No. 605262) and NDRG2, 67% between NDRG1 and NDRG3, and 58% between NDRG2 and NDRG3. By radiation hybrid analysis, Kalaydjieva et al. (2000) mapped the NDRG2 gene to chromosome 14q11.2.

[40853] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[40854] Kalaydjieva, L.; Gresham, D.; Gooding, R.; Heather, L.;

Baas, F.; de Jonge, R.; Blechschmidt, K.; Angelicheva, D.; Chandler, D.; Worsley, P.; Rosenthal, A.; King, R. H. M.; Thomas, P. K. : N-myc downstream-regulated gene 1 is mutated in hereditary motor and sensory neuropathy-Lom. Am. J. Hum. Genet. 67: 47-58, 2000. ; and

[40855] Piquemal, D.; Joulia, D.; Balaguer, P.; Basset, A.; Marti, J.; Commes, T. : Differential expression of the RTP/Drg1/Ndr1 gene product in proliferating and growth arrested cells. Biochi.

[40856] Further studies establishing the function and utilities of NDRG2 are found in John Hopkins OMIM database record ID 605272, and in cited publications numbered 135 and 6612 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. AD022 (Accession XM_165725) is another VGAM1130 host target gene. AD022 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AD022, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AD022 BINDING SITE, designated SEQ ID:43737, to the nucleotide sequence of VGAM1130 RNA, herein designated VGAM RNA, also designated SEQ

ID:3841.

[40857] Another function of VGAM1130 is therefore inhibition of AD022 (Accession XM_165725). Accordingly, utilities of VGAM1130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AD022. KIAA0534 (Accession XM_049349) is another VGAM1130 host target gene. KIAA0534 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0534, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0534 BINDING SITE, designated SEQ ID:35384, to the nucleotide sequence of VGAM1130 RNA, herein designated VGAM RNA, also designated SEQ ID:3841.

[40858] Another function of VGAM1130 is therefore inhibition of KIAA0534 (Accession XM_049349). Accordingly, utilities of VGAM1130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0534. Oxysterol Binding Protein-like 2 (OSBPL2, Accession NM_014835) is another VGAM1130 host target gene. OSBPL2 BINDING SITE1 and OSBPL2 BINDING SITE2 are HOST TARGET binding sites found in untranslated re-

gions of mRNA encoded by OSBPL2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OSBPL2 BINDING SITE1 and OSBPL2 BINDING SITE2, designated SEQ ID:16848 and SEQ ID:29316 respectively, to the nucleotide sequence of VGAM1130 RNA, herein designated VGAM RNA, also designated SEQ ID:3841.

[40859] Another function of VGAM1130 is therefore inhibition of Oxysterol Binding Protein-like 2 (OSBPL2, Accession NM_014835). Accordingly, utilities of VGAM1130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OSBPL2. TUBB5 (Accession NM_006087) is another VGAM1130 host target gene. TUBB5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TUBB5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TUBB5 BINDING SITE, designated SEQ ID:12729, to the nucleotide sequence of VGAM1130 RNA, herein designated VGAM RNA, also designated SEQ ID:3841.

[40860] Another function of VGAM1130 is therefore inhibition of TUBB5 (Accession NM_006087). Accordingly, utilities of VGAM1130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TUBB5. LOC157657 (Accession XM_088352) is another VGAM1130 host target gene. LOC157657 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC157657, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157657 BINDING SITE, designated SEQ ID:39625, to the nucleotide sequence of VGAM1130 RNA, herein designated VGAM RNA, also designated SEQ ID:3841.

[40861] Another function of VGAM1130 is therefore inhibition of LOC157657 (Accession XM_088352). Accordingly, utilities of VGAM1130 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157657. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1131 (VGAM1131) viral gene, which modulates expression of respective host target genes

thereof, the function and utility of which host target genes is known in the art.

[40862] VGAM1131 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1131 was detected is described hereinabove with reference to Figs. 1-8.

[40863] VGAM1131 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Barley Stripe Mosaic Virus. VGAM1131 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[40864] VGAM1131 gene encodes a VGAM1131 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1131 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1131 precursor RNA is designated SEQ ID:1117, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1117 is located at position 1786 relative to the genome of Barley Stripe Mosaic Virus.

[40865] VGAM1131 precursor RNA folds onto itself, forming VGAM1131 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[40866] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1131 folded precursor RNA into VGAM1131 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM1131 RNA is designated SEQ ID:3842, and is provided hereinbelow with reference to the sequence listing part.

[40867] VGAM1131 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1131 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1131 host target RNA comprises three regions, as is typical of mRNA of a pro-

tein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[40868] VGAM1131 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1131 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1131 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1131 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1131 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in

the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[40869] The complementary binding of VGAM1131 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1131 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1131 host target RNA into VGAM1131 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[40870] It is appreciated that VGAM1131 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1131 host target genes. The mRNA of each one of this plurality of VGAM1131 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1131 RNA, herein designated VGAM RNA, and which when bound by VGAM1131 RNA causes inhibition of translation of respective one or more VGAM1131 host target proteins.

[40871] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM1131 gene, herein designated VGAM GENE, on one or more VGAM1131 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[40872] It is yet further appreciated that a function of VGAM1131 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1131 include diagnosis, prevention and treatment of viral infection by Barley Stripe Mosaic Virus. Specific functions, and accordingly utilities, of VGAM1131 correlate with, and may be deduced from, the identity of the host target genes which VGAM1131 binds and inhibits, and the function of these host target genes, as

elaborated hereinbelow.

[40873] Nucleotide sequences of the VGAM1131 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1131 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1131 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1131 are further described hereinbelow with reference to Table 1.

[40874] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1131 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1131 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[40875] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1131 gene, herein designated VGAM is inhibition of expression of VGAM1131 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1131 correlate with, and may be deduced from, the identity of the target genes which VGAM1131 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[40876] Myotubularin Related Protein 8 (MTMR8, Accession NM_015458) is a VGAM1131 host target gene. MTMR8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MTMR8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MTMR8 BINDING SITE, designated SEQ ID:17751, to the nucleotide sequence of VGAM1131 RNA, herein designated VGAM RNA, also designated SEQ ID:3842.

[40877] A function of VGAM1131 is therefore inhibition of Myotubularin Related Protein 8 (MTMR8, Accession NM_015458), a gene which could be a tyrosine-phosphatase. Accordingly, utilities of VGAM1131 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MTMR8. The function of MTMR8 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM379.FLJ10520 (Accession NM_018124) is another VGAM1131 host target gene. FLJ10520 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10520, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10520 BINDING SITE, designated SEQ ID:19909, to the nucleotide sequence of VGAM1131 RNA, herein designated VGAM RNA, also designated SEQ ID:3842.

[40878] Another function of VGAM1131 is therefore inhibition of FLJ10520 (Accession NM_018124). Accordingly, utilities of VGAM1131 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10520. FLJ31564 (Accession NM_144720) is another VGAM1131 host target gene. FLJ31564 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ31564, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ31564 BINDING SITE, designated SEQ ID:29541, to the nucleotide sequence of VGAM1131 RNA, herein designated VGAM RNA, also designated SEQ ID:3842.

[40879] Another function of VGAM1131 is therefore inhibition of FLJ31564 (Accession NM_144720). Accordingly, utilities of VGAM1131 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ31564. MGC13114 (Accession NM_032366) is another VGAM1131 host target gene. MGC13114 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC13114, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC13114 BINDING SITE, designated SEQ ID:26153, to the nucleotide sequence of VGAM1131 RNA, herein designated VGAM RNA, also designated SEQ ID:3842.

[40880] Another function of VGAM1131 is therefore inhibition of MGC13114 (Accession NM_032366). Accordingly, utilities of VGAM1131 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC13114. LOC145836 (Accession XM_096881) is another VGAM1131 host target gene. LOC145836 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC145836, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145836 BINDING SITE, designated SEQ ID:40614, to

the nucleotide sequence of VGAM1131 RNA, herein designated VGAM RNA, also designated SEQ ID:3842.

[40881] Another function of VGAM1131 is therefore inhibition of LOC145836 (Accession XM_096881). Accordingly, utilities of VGAM1131 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145836. LOC221466 (Accession XM_168087) is another VGAM1131 host target gene. LOC221466 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221466, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221466 BINDING SITE, designated SEQ ID:44996, to the nucleotide sequence of VGAM1131 RNA, herein designated VGAM RNA, also designated SEQ ID:3842.

[40882] Another function of VGAM1131 is therefore inhibition of LOC221466 (Accession XM_168087). Accordingly, utilities of VGAM1131 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221466. LOC57086 (Accession NM_020351) is another VGAM1131 host target gene. LOC57086 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by LOC57086, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC57086 BINDING SITE, designated SEQ ID:21617, to the nucleotide sequence of VGAM1131 RNA, herein designated VGAM RNA, also designated SEQ ID:3842.

[40883] Another function of VGAM1131 is therefore inhibition of LOC57086 (Accession NM_020351). Accordingly, utilities of VGAM1131 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC57086. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1132 (VGAM1132) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[40884] VGAM1132 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1132 was detected is described hereinabove with reference to Figs. 1-8.

[40885] VGAM1132 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Barley Stripe Mosaic Virus. VGAM1132 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[40886] VGAM1132 gene encodes a VGAM1132 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1132 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1132 precursor RNA is designated SEQ ID:1118, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1118 is located at position 849 relative to the genome of Barley Stripe Mosaic Virus.

[40887] VGAM1132 precursor RNA folds onto itself, forming VGAM1132 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[40888] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1132 folded precursor RNA into VGAM1132 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1132 RNA is designated SEQ ID:3843, and is provided hereinbelow with reference to the sequence listing part.

[40889] VGAM1132 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1132 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1132 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[40890] VGAM1132 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1132 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM1132 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1132 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1132 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[40891] The complementary binding of VGAM1132 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1132 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1132

host target RNA into VGAM1132 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[40892] It is appreciated that VGAM1132 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1132 host target genes. The mRNA of each one of this plurality of VGAM1132 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1132 RNA, herein designated VGAM RNA, and which when bound by VGAM1132 RNA causes inhibition of translation of respective one or more VGAM1132 host target proteins.

[40893] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1132 gene, herein designated VGAM GENE, on one or more VGAM1132 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[40894] It is yet further appreciated that a function of VGAM1132 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1132 include diagnosis, prevention and treatment of viral infection by Barley Stripe Mosaic Virus. Specific functions, and accordingly utilities, of VGAM1132 correlate with, and may be deduced from, the identity of the host target genes which VGAM1132 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[40895] Nucleotide sequences of the VGAM1132 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1132 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1132 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1132 are further

described hereinbelow with reference to Table 1.

[40896] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1132 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1132 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[40897] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1132 gene, herein designated VGAM is inhibition of expression of VGAM1132 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1132 correlate with, and may be deduced from, the identity of the target genes which VGAM1132 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[40898] Fibroblast Growth Factor 2 (basic) (FGF2, Accession NM_002006) is a VGAM1132 host target gene. FGF2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FGF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

FGF2 BINDING SITE, designated SEQ ID:7736, to the nucleotide sequence of VGAM1132 RNA, herein designated VGAM RNA, also designated SEQ ID:3843.

[40899] A function of VGAM1132 is therefore inhibition of Fibroblast Growth Factor 2 (basic) (FGF2, Accession NM_002006), a gene which probably involved in nervous system development and function. Accordingly, utilities of VGAM1132 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FGF2. The function of FGF2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM51. Lactate Dehydrogenase B (LDHB, Accession NM_002300) is another VGAM1132 host target gene. LDHB BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LDHB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LDHB BINDING SITE, designated SEQ ID:8089, to the nucleotide sequence of VGAM1132 RNA, herein designated VGAM RNA, also designated SEQ ID:3843.

[40900] Another function of VGAM1132 is therefore inhibition of

Lactate Dehydrogenase B (LDHB, Accession NM_002300), a gene which causes dehydrogenation of lactate. Accordingly, utilities of VGAM1132 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LDHB. The function of LDHB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM273. Protocadherin 11 X-linked (PCDH11X, Accession NM_032968) is another VGAM1132 host target gene. PCDH11X BINDING SITE1 and PCDH11X BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PCDH11X, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDH11X BINDING SITE1 and PCDH11X BINDING SITE2, designated SEQ ID:26794 and SEQ ID:26809 respectively, to the nucleotide sequence of VGAM1132 RNA, herein designated VGAM RNA, also designated SEQ ID:3843.

[40901] Another function of VGAM1132 is therefore inhibition of Protocadherin 11 X-linked (PCDH11X, Accession NM_032968), a gene which is thought to play a fundamental role in cell-cell recognition essential for the seg-

mental development and function of the central nervous system. Accordingly, utilities of VGAM1132 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDH11X. The function of PCDH11X and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM433.AFAP (Accession NM_021638) is another VGAM1132 host target gene. AFAP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AFAP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AFAP BINDING SITE, designated SEQ ID:22294, to the nucleotide sequence of VGAM1132 RNA, herein designated VGAM RNA, also designated SEQ ID:3843.

[40902] Another function of VGAM1132 is therefore inhibition of AFAP (Accession NM_021638). Accordingly, utilities of VGAM1132 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AFAP. FLJ12484 (Accession NM_022767) is another VGAM1132 host target gene. FLJ12484 BINDING SITE1 and FLJ12484

BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FLJ12484, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12484 BINDING SITE1 and FLJ12484 BINDING SITE2, designated SEQ ID:23017 and SEQ ID:34515 respectively, to the nucleotide sequence of VGAM1132 RNA, herein designated VGAM RNA, also designated SEQ ID:3843.

[40903] Another function of VGAM1132 is therefore inhibition of FLJ12484 (Accession NM_022767). Accordingly, utilities of VGAM1132 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12484. KIAA0040 (Accession NM_014656) is another VGAM1132 host target gene. KIAA0040 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0040, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0040 BINDING SITE, designated SEQ ID:16098, to the nucleotide sequence of VGAM1132 RNA, herein designated VGAM RNA, also designated SEQ ID:3843.

[40904] Another function of VGAM1132 is therefore inhibition of KIAA0040 (Accession NM_014656). Accordingly, utilities of VGAM1132 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0040. PRO1048 (Accession NM_018497) is another VGAM1132 host target gene. PRO1048 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRO1048, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO1048 BINDING SITE, designated SEQ ID:20562, to the nucleotide sequence of VGAM1132 RNA, herein designated VGAM RNA, also designated SEQ ID:3843.

[40905] Another function of VGAM1132 is therefore inhibition of PRO1048 (Accession NM_018497). Accordingly, utilities of VGAM1132 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO1048. LOC149117 (Accession XM_097587) is another VGAM1132 host target gene. LOC149117 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149117, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149117 BINDING SITE, designated SEQ ID:40955, to the nucleotide sequence of VGAM1132 RNA, herein designated VGAM RNA, also designated SEQ ID:3843.

[40906] Another function of VGAM1132 is therefore inhibition of LOC149117 (Accession XM_097587). Accordingly, utilities of VGAM1132 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149117. LOC220929 (Accession XM_166134) is another VGAM1132 host target gene. LOC220929 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC220929, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220929 BINDING SITE, designated SEQ ID:43929, to the nucleotide sequence of VGAM1132 RNA, herein designated VGAM RNA, also designated SEQ ID:3843.

[40907] Another function of VGAM1132 is therefore inhibition of LOC220929 (Accession XM_166134). Accordingly, utilities of VGAM1132 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC220929. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1133 (VGAM1133) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[40908] VGAM1133 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1133 was detected is described hereinabove with reference to Figs. 1–8.

[40909] VGAM1133 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Maize Rayado Fino Virus. VGAM1133 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[40910] VGAM1133 gene encodes a VGAM1133 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1133 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1133 precursor RNA is designated SEQ ID:1119, and is provided hereinbelow with ref–

erence to the sequence listing part. Nucleotide sequence SEQ ID:1119 is located at position 5936 relative to the genome of Maize Rayado Fino Virus.

- [40911] VGAM1133 precursor RNA folds onto itself, forming VGAM1133 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [40912] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1133 folded precursor RNA into VGAM1133 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1133 RNA is designated SEQ ID:3844, and is provided hereinbelow with reference to the sequence listing part.

[40913] VGAM1133 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1133 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1133 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[40914] VGAM1133 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1133 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1133 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1133 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM1133 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[40915] The complementary binding of VGAM1133 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1133 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1133 host target RNA into VGAM1133 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[40916] It is appreciated that VGAM1133 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1133 host target genes. The mRNA of each one of this plurality of VGAM1133 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1133 RNA, herein designated VGAM RNA, and which when bound by VGAM1133 RNA causes

inhibition of translation of respective one or more VGAM1133 host target proteins.

[40917] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1133 gene, herein designated VGAM GENE, on one or more VGAM1133 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[40918] It is yet further appreciated that a function of VGAM1133 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1133 include diagnosis, prevention and

treatment of viral infection by Maize Rayado Fino Virus. Specific functions, and accordingly utilities, of VGAM1133 correlate with, and may be deduced from, the identity of the host target genes which VGAM1133 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[40919] Nucleotide sequences of the VGAM1133 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1133 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1133 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1133 are further described hereinbelow with reference to Table 1.

[40920] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1133 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1133 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[40921] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1133 gene, herein designated VGAM is inhibition of expression of VGAM1133 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM1133 correlate with, and may be deduced from, the identity of the target genes which VGAM1133 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[40922] Solute Carrier Family 2 (facilitated glucose transporter), Member 1 (SLC2A1, Accession NM_006516) is a VGAM1133 host target gene. SLC2A1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC2A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC2A1 BINDING SITE, designated SEQ ID:13264, to the nucleotide sequence of VGAM1133 RNA, herein designated VGAM RNA, also designated SEQ ID:3844.

[40923] A function of VGAM1133 is therefore inhibition of Solute Carrier Family 2 (facilitated glucose transporter), Member 1 (SLC2A1, Accession NM_006516). Accordingly, utilities of VGAM1133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC2A1. Chromosome 21 Open Reading Frame 25 (C21orf25, Accession XM_032945) is another VGAM1133

host target gene. C21orf25 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C21orf25, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C21orf25 BINDING SITE, designated SEQ ID:31800, to the nucleotide sequence of VGAM1133 RNA, herein designated VGAM RNA, also designated SEQ ID:3844.

[40924] Another function of VGAM1133 is therefore inhibition of Chromosome 21 Open Reading Frame 25 (C21orf25, Accession XM_032945). Accordingly, utilities of VGAM1133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C21orf25.

FLJ10849 (Accession NM_018243) is another VGAM1133 host target gene. FLJ10849 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10849, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10849 BINDING SITE, designated SEQ ID:20204, to the nucleotide sequence of VGAM1133 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:3844.

[40925] Another function of VGAM1133 is therefore inhibition of FLJ10849 (Accession NM_018243). Accordingly, utilities of VGAM1133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10849. Musculin (activated B-cell factor-1) (MSC, Accession XM_084266) is another VGAM1133 host target gene. MSC BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MSC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MSC BINDING SITE, designated SEQ ID:37533, to the nucleotide sequence of VGAM1133 RNA, herein designated VGAM RNA, also designated SEQ ID:3844.

[40926] Another function of VGAM1133 is therefore inhibition of Musculin (activated B-cell factor-1) (MSC, Accession XM_084266). Accordingly, utilities of VGAM1133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MSC. Ras Association (RalGDS/AF-6) Domain Family 2 (RASSF2, Accession NM_014737) is another VGAM1133 host target gene. RASSF2 BINDING SITE is HOST TARGET binding site found

in the 3' untranslated region of mRNA encoded by RASSF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RASSF2 BINDING SITE, designated SEQ ID:16389, to the nucleotide sequence of VGAM1133 RNA, herein designated VGAM RNA, also designated SEQ ID:3844.

[40927] Another function of VGAM1133 is therefore inhibition of Ras Association (RalGDS/AF-6) Domain Family 2 (RASSF2, Accession NM_014737). Accordingly, utilities of VGAM1133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RASSF2. Zinc Finger Protein 337 (ZNF337, Accession XM_042807) is another VGAM1133 host target gene. ZNF337 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF337, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF337 BINDING SITE, designated SEQ ID:33770, to the nucleotide sequence of VGAM1133 RNA, herein designated VGAM RNA, also designated SEQ

ID:3844.

[40928] Another function of VGAM1133 is therefore inhibition of Zinc Finger Protein 337 (ZNF337, Accession XM_042807). Accordingly, utilities of VGAM1133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF337. LOC154834 (Accession XM_098621) is another VGAM1133 host target gene. LOC154834 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC154834, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154834 BINDING SITE, designated SEQ ID:41730, to the nucleotide sequence of VGAM1133 RNA, herein designated VGAM RNA, also designated SEQ ID:3844.

[40929] Another function of VGAM1133 is therefore inhibition of LOC154834 (Accession XM_098621). Accordingly, utilities of VGAM1133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154834. LOC200720 (Accession XM_117264) is another VGAM1133 host target gene. LOC200720 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by LOC200720, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200720 BINDING SITE, designated SEQ ID:43342, to the nucleotide sequence of VGAM1133 RNA, herein designated VGAM RNA, also designated SEQ ID:3844.

[40930] Another function of VGAM1133 is therefore inhibition of LOC200720 (Accession XM_117264). Accordingly, utilities of VGAM1133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200720. LOC91461 (Accession XM_038576) is another VGAM1133 host target gene. LOC91461 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91461, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91461 BINDING SITE, designated SEQ ID:32869, to the nucleotide sequence of VGAM1133 RNA, herein designated VGAM RNA, also designated SEQ ID:3844.

[40931] Another function of VGAM1133 is therefore inhibition of LOC91461 (Accession XM_038576). Accordingly, utilities

of VGAM1133 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91461. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1134 (VGAM1134) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[40932] VGAM1134 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1134 was detected is described hereinabove with reference to Figs. 1-8.

[40933] VGAM1134 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Maize Rayado Fino Virus. VGAM1134 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[40934] VGAM1134 gene encodes a VGAM1134 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1134 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nu-

cleotide sequence of VGAM1134 precursor RNA is designated SEQ ID:1120, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1120 is located at position 4286 relative to the genome of Maize Rayado Fino Virus.

- [40935] VGAM1134 precursor RNA folds onto itself, forming VGAM1134 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [40936] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1134 folded precursor RNA into VGAM1134 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1134 RNA is designated SEQ ID:3845, and

is provided hereinbelow with reference to the sequence listing part.

[40937] VGAM1134 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1134 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1134 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[40938] VGAM1134 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1134 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1134 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing – VGAM1134 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1134 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[40939] The complementary binding of VGAM1134 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1134 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1134 host target RNA into VGAM1134 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[40940] It is appreciated that VGAM1134 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1134 host target genes. The mRNA of each one of this plurality of VGAM1134 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com–

plementary to VGAM1134 RNA, herein designated VGAM RNA, and which when bound by VGAM1134 RNA causes inhibition of translation of respective one or more VGAM1134 host target proteins.

[40941] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1134 gene, herein designated VGAM GENE, on one or more VGAM1134 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[40942] It is yet further appreciated that a function of VGAM1134 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1134 include diagnosis, prevention and treatment of viral infection by Maize Rayado Fino Virus. Specific functions, and accordingly utilities, of VGAM1134 correlate with, and may be deduced from, the identity of the host target genes which VGAM1134 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[40943] Nucleotide sequences of the VGAM1134 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1134 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1134 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1134 are further described hereinbelow with reference to Table 1.

[40944] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1134 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1134 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[40945] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM1134 gene, herein designated VGAM is inhibition of expression of VGAM1134 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1134 correlate with, and may be deduced from, the identity of the target genes which VGAM1134 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[40946] AWP1 (Accession NM_019006) is a VGAM1134 host target gene. AWP1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by AWP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AWP1 BINDING SITE, designated SEQ ID:21077, to the nucleotide sequence of VGAM1134 RNA, herein designated VGAM RNA, also designated SEQ ID:3845.

[40947] A function of VGAM1134 is therefore inhibition of AWP1 (Accession NM_019006). Accordingly, utilities of VGAM1134 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AWP1. LOC199796 (Accession XM_058994) is another VGAM1134 host target gene. LOC199796 BINDING SITE is HOST TARGET binding site found in the 5` untranslated

region of mRNA encoded by LOC199796, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199796 BINDING SITE, designated SEQ ID:36806, to the nucleotide sequence of VGAM1134 RNA, herein designated VGAM RNA, also designated SEQ ID:3845.

[40948] Another function of VGAM1134 is therefore inhibition of LOC199796 (Accession XM_058994). Accordingly, utilities of VGAM1134 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199796. LOC257464 (Accession XM_116972) is another VGAM1134 host target gene. LOC257464 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC257464, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257464 BINDING SITE, designated SEQ ID:43163, to the nucleotide sequence of VGAM1134 RNA, herein designated VGAM RNA, also designated SEQ ID:3845.

[40949] Another function of VGAM1134 is therefore inhibition of LOC257464 (Accession XM_116972). Accordingly, utilities

of VGAM1134 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257464. LOC51313 (Accession NM_016613) is another VGAM1134 host target gene. LOC51313 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51313, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51313 BINDING SITE, designated SEQ ID:18718, to the nucleotide sequence of VGAM1134 RNA, herein designated VGAM RNA, also designated SEQ ID:3845.

[40950] Another function of VGAM1134 is therefore inhibition of LOC51313 (Accession NM_016613). Accordingly, utilities of VGAM1134 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51313. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1135 (VGAM1135) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[40951] VGAM1135 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1135 was detected is described hereinabove with reference to Figs. 1-8.

[40952] VGAM1135 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Maize Rayado Fino Virus. VGAM1135 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[40953] VGAM1135 gene encodes a VGAM1135 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1135 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1135 precursor RNA is designated SEQ ID:1121, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1121 is located at position 1316 relative to the genome of Maize Rayado Fino Virus.

[40954] VGAM1135 precursor RNA folds onto itself, forming VGAM1135 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the

art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[40955] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1135 folded precursor RNA into VGAM1135 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of VGAM1135 RNA is designated SEQ ID:3846, and is provided hereinbelow with reference to the sequence listing part.

[40956] VGAM1135 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1135 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1135 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated

5`UTR, PROTEIN CODING and 3`UTR respectively.

[40957] VGAM1135 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1135 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1135 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1135 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1135 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[40958] The complementary binding of VGAM1135 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1135 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1135 host target RNA into VGAM1135 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[40959] It is appreciated that VGAM1135 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1135 host target genes. The mRNA of each one of this plurality of VGAM1135 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1135 RNA, herein designated VGAM RNA, and which when bound by VGAM1135 RNA causes inhibition of translation of respective one or more VGAM1135 host target proteins.

[40960] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1135 gene, herein designated VGAM GENE, on one or more VGAM1135 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[40961] It is yet further appreciated that a function of VGAM1135 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1135 include diagnosis, prevention and treatment of viral infection by Maize Rayado Fino Virus. Specific functions, and accordingly utilities, of VGAM1135 correlate with, and may be deduced from, the identity of the host target genes which VGAM1135 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[40962] Nucleotide sequences of the VGAM1135 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the
`diced` VGAM1135 RNA, herein designated VGAM RNA,
and a schematic representation of the secondary folding
of VGAM1135 folded precursor RNA, herein designated
VGAM FOLDED PRECURSOR RNA, of VGAM1135 are further
described hereinbelow with reference to Table 1.

[40963] Nucleotide sequences of host target binding sites, such as
BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of
Fig. 1, found on VGAM1135 host target RNA, and
schematic representation of the complementarity of each
of these host target binding sites to VGAM1135 RNA,
herein designated VGAM RNA, are described hereinbelow
with reference to Table 2.

[40964] As mentioned hereinabove with reference to Fig. 1, a
function of VGAM1135 gene, herein designated VGAM is
inhibition of expression of VGAM1135 target genes. It is
appreciated that specific functions, and accordingly utili-
ties, of VGAM1135 correlate with, and may be deduced
from, the identity of the target genes which VGAM1135
binds and inhibits, and the function of these target genes,
as elaborated hereinbelow.

[40965] ATP-binding Cassette, Sub-family C (CFTR/MRP), Member
3 (ABCC3, Accession NM_020038) is a VGAM1135 host

target gene. ABCC3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ABCC3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ABCC3 BINDING SITE, designated SEQ ID:21294, to the nucleotide sequence of VGAM1135 RNA, herein designated VGAM RNA, also designated SEQ ID:3846.

[40966] A function of VGAM1135 is therefore inhibition of ATP-binding Cassette, Sub-family C (CFTR/MRP), Member 3 (ABCC3, Accession NM_020038), a gene which may act as an inducible transporter in the biliary and intestinal excretion of organic anions. Accordingly, utilities of VGAM1135 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABCC3. The function of ABCC3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM505. ATP-binding Cassette, Sub-family D (ALD), Member 1 (ABCD1, Accession NM_000033) is another VGAM1135 host target gene. ABCD1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by ABCD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ABCD1 BINDING SITE, designated SEQ ID:5472, to the nucleotide sequence of VGAM1135 RNA, herein designated VGAM RNA, also designated SEQ ID:3846.

[40967] Another function of VGAM1135 is therefore inhibition of ATP-binding Cassette, Sub-family D (ALD), Member 1 (ABCD1, Accession NM_000033). Accordingly, utilities of VGAM1135 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABCD1. Adrenergic, Alpha-2A-, Receptor (ADRA2A, Accession NM_000681) is another VGAM1135 host target gene. ADRA2A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ADRA2A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADRA2A BINDING SITE, designated SEQ ID:6337, to the nucleotide sequence of VGAM1135 RNA, herein designated VGAM RNA, also designated SEQ ID:3846.

[40968] Another function of VGAM1135 is therefore inhibition of Adrenergic, Alpha-2A-, Receptor (ADRA2A, Accession NM_000681), a gene which mediates the effects of epinephrine and norepinephrine. Accordingly, utilities of VGAM1135 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADRA2A. The function of ADRA2A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM602.UDP-Gal:betaGlcNAc Beta 1,4-Galactosyltransferase, Polypeptide 6 (B4GALT6, Accession XM_008799) is another VGAM1135 host target gene. B4GALT6 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by B4GALT6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of B4GALT6 BINDING SITE, designated SEQ ID:30096, to the nucleotide sequence of VGAM1135 RNA, herein designated VGAM RNA, also designated SEQ ID:3846.

[40969] Another function of VGAM1135 is therefore inhibition of UDP-Gal:betaGlcNAc Beta 1,4- Galactosyltransferase,

Polypeptide 6 (B4GALT6, Accession XM_008799). Accordingly, utilities of VGAM1135 include diagnosis, prevention and treatment of diseases and clinical conditions associated with B4GALT6. Caspase Recruitment Domain Family, Member 10 (CARD10, Accession NM_014550) is another VGAM1135 host target gene. CARD10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CARD10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CARD10 BINDING SITE, designated SEQ ID:15872, to the nucleotide sequence of VGAM1135 RNA, herein designated VGAM RNA, also designated SEQ ID:3846.

[40970] Another function of VGAM1135 is therefore inhibition of Caspase Recruitment Domain Family, Member 10 (CARD10, Accession NM_014550), a gene which functions to couple cell surface receptor stimulation and protein kinase C (see 176982) activation to the induction of NFkB through its interaction with BCL10. Accordingly, utilities of VGAM1135 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CARD10. The function of CARD10 has been established by

previous studies. The caspase recruitment domain (CARD) is a protein module that consists of 6 or 7 antiparallel alpha helices. It participates in apoptosis signaling through highly specific protein-protein homophilic interactions. CARDS induce nuclear factor kappa-B (NFKB; 164011) activity through the IKK (e.g., IKBKB; 603258) complex. CARD9 (OMIM Ref. No. 607212), CARD10, CARD11 (OMIM Ref. No. 607210), and CARD14 (OMIM Ref. No. 607211) interact with BCL10 (OMIM Ref. No. 603517) and are involved in NFKB signaling complexes. Except for CARD9, these CARD proteins are members of the membrane-associated guanylate kinase (MAGUK) family. By coprecipitation analysis, McAllister-Lucas et al. (2001) showed that BIMP1, in the presence of BCL10, interacts with MALT1 (OMIM Ref. No. 604860) and cooperates in a signaling pathway through a CARD-mediated mechanism. Analysis of stimulated T cells suggested that BIMP1, through its interaction with BCL10, functions to couple cell surface receptor stimulation and protein kinase C (see OMIM Ref. No. 176982) activation to the induction of NFKB.

[40971] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

- [40972] Gaide, O.; Martinon, F.; Micheau, O.; Bonnet, D.; Thome, M.; Tschopp, J. : Carma1, a CARD-containing binding partner of Bcl10, induces Bcl10 phosphorylation and NF-kappa-B activation. FEBS Lett. 496: 121-127, 2001. ; and
- [40973] McAllister-Lucas, L. M.; Inohara, N.; Lucas, P. C.; Ruland, J.; Benito, A.; Li, Q.; Chen, S.; Chen, F. F.; Yamaoka, S.; Verma, I. M.; Mak, T. W.; Nunez, G. : Bimp1, a MAGUK family membe.
- [40974] Further studies establishing the function and utilities of CARD10 are found in John Hopkins OMIM database record ID 607209, and in cited publications numbered 5565-5567 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Dishevelled Associated Activator of Morphogenesis 2 (DAAM2, Accession XM_166434) is another VGAM1135 host target gene. DAAM2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DAAM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DAAM2 BINDING SITE, designated SEQ ID:44329, to the nucleotide sequence of VGAM1135 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:3846.

[40975] Another function of VGAM1135 is therefore inhibition of Dishevelled Associated Activator of Morphogenesis 2 (DAAM2, Accession XM_166434), a gene which controls cell polarity and movement during development. Accordingly, utilities of VGAM1135 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DAAM2. The function of DAAM2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM247. Engrailed Homolog 2 (EN2, Accession NM_001427) is another VGAM1135 host target gene. EN2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by EN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EN2 BINDING SITE, designated SEQ ID:7144, to the nucleotide sequence of VGAM1135 RNA, herein designated VGAM RNA, also designated SEQ ID:3846.

[40976] Another function of VGAM1135 is therefore inhibition of Engrailed Homolog 2 (EN2, Accession NM_001427), a gene which may be required for normal cerebellar devel-

opment; a homeobox protein, very strongly similar to murine En2. Accordingly, utilities of VGAM1135 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EN2. The function of EN2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM232.Exostoses (multiple)-like 1 (EXTL1, Accession NM_004455) is another VGAM1135 host target gene. EXTL1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by EXTL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EXTL1 BINDING SITE, designated SEQ ID:10757, to the nucleotide sequence of VGAM1135 RNA, herein designated VGAM RNA, also designated SEQ ID:3846.

[40977] Another function of VGAM1135 is therefore inhibition of Exostoses (multiple)-like 1 (EXTL1, Accession NM_004455), a gene which probably contribute to the synthesis of heparan sulfate and heparin. Accordingly, utilities of VGAM1135 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with EXTL1. The function of EXTL1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM806. Histone Deacetylase 7A (HDAC7A, Accession NM_015401) is another VGAM1135 host target gene. HDAC7A BINDING SITE1 and HDAC7A BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by HDAC7A, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HDAC7A BINDING SITE1 and HDAC7A BINDING SITE2, designated SEQ ID:17712 and SEQ ID:18682 respectively, to the nucleotide sequence of VGAM1135 RNA, herein designated VGAM RNA, also designated SEQ ID:3846.

[40978] Another function of VGAM1135 is therefore inhibition of Histone Deacetylase 7A (HDAC7A, Accession NM_015401). Accordingly, utilities of VGAM1135 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HDAC7A. Peptidylprolyl Isomerase (cyclophilin)-like 1 (PPIL1, Accession NM_016059) is another VGAM1135 host target gene. PPIL1 BINDING SITE is

HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PPIL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPIL1 BINDING SITE, designated SEQ ID:18135, to the nucleotide sequence of VGAM1135 RNA, herein designated VGAM RNA, also designated SEQ ID:3846.

[40979] Another function of VGAM1135 is therefore inhibition of Peptidylprolyl Isomerase (cyclophilin)-like 1 (PPIL1, Accession NM_016059), a gene which catalyzes the cis-trans isomerization of proline imidic peptide bonds in oligopeptides. Accordingly, utilities of VGAM1135 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPIL1. The function of PPIL1 has been established by previous studies. Cyclophilin (see OMIM Ref. No. 123840), first identified as a protein with high binding affinity for the immunosuppressive agent cyclosporin A, is one of the most effective therapeutic agents for prevention of graft rejection after organ transplantation. Ozaki et al. (1996) isolated a human cDNA clone encoding a protein homologous to cyclophilins and showed that it is conserved in species ranging from hu-

man to prokaryotes. This cDNA contained an open reading frame of 498 nucleotides encoding a polypeptide of 166 amino acids. The predicted amino acid sequence had 41.6% homology to the human cyclophilins. Northern blot analysis indicated ubiquitous expression in adult human tissues, with the most abundant expression in heart and skeletal muscle. Ozaki et al. (1996) localized the PPIL1 gene to 2p23.3–p23.1 by FISH. However, Mann et al. (1998) assigned the PPIL1 gene to 6p21.1 by FISH and radiation hybrid mapping.

[40980] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[40981] Mann, S. S.; Pettenati, M. J.; von Kap-herr, C.; Hart, T. C. : Reassignment of peptidyl prolyl isomerase-like 1 gene (PPIL1) to human chromosome region 6p21.1 by radiation hybrid mapping and fluorescence in situ hybridization. Cytogenet. Cell Genet. 83: 228–229, 1998. ; and

[40982] Ozaki, K.; Fujiwara, T.; Kawai, A.; Shimizu, F.; Takami, S.; Okuno, S.; Takeda, S.; Shimada, Y.; Nagata, M.; Watanabe, T.; Takaichi, A.; Takahashi, E.; Nakamura, Y.; Shin, S. : Cloning.

[40983] Further studies establishing the function and utilities of

PPIL1 are found in John Hopkins OMIM database record ID 601301, and in cited publications numbered 6505–6506 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Pregnancy Specific Beta–1–glycoprotein 4 (PSG4, Accession NM_002780) is another VGAM1135 host target gene. PSG4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PSG4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PSG4 BINDING SITE, designated SEQ ID:8671, to the nucleotide sequence of VGAM1135 RNA, herein designated VGAM RNA, also designated SEQ ID:3846.

[40984] Another function of VGAM1135 is therefore inhibition of Pregnancy Specific Beta–1–glycoprotein 4 (PSG4, Accession NM_002780), a gene which is a member of the pregnancy–specific glycoprotein (PSG) and CEA families. Accordingly, utilities of VGAM1135 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PSG4. The function of PSG4 has been established by previous studies. The human pregnancy–specific glycoproteins (PSGs) are a group of molecules that

are mainly produced by the placental syncytiotrophoblasts during pregnancy. PSGs comprise a subgroup of the carcinoembryonic antigen (CEA) family, which belongs to the immunoglobulin superfamily. See PSG3 (OMIM Ref. No. 176392) for additional information about PSGs. Teglund et al. (1994) found that the PSG4 gene contains 6 exons. They noted that PSG9, which had been thought to be a novel gene, is in fact an allelic variant of PSG4 that differs by 6 bp in the coding region. (The OMIM Ref. No. 176398.) Studies by several groups resulted in the mapping of the CEA gene family to 19q13.1–q13.2 (Thompson et al., 1990; Thompson et al., 1992; Tynan et al., 1992; Trask et al., 1993). The PSG subgroup is located telomeric of the CEA subgroup, and together they span approximately 1.1 to 1.2 Mb (Brandriff et al., 1992; Tynan et al., 1992). Using a high-resolution restriction fragment fingerprinting technique, Olsen et al. (1994) assembled 256 cosmids spanning the PSG region on 19q13.2 into a single 700-kb contig. FISH to sperm pronuclei and cosmid walking experiments indicated that this PSG contig is telomeric of CGM8 at the telomeric end of the CEA subgroup gene cluster. Detailed restriction mapping and hybridization with gene-specific probes indicated that the order of the

11 PSG genes in the contig is cen--PSG3--PSG8 (OMIM Ref. No. 176397)--PSG12 (PSG10; 176399)--PSG1 (OMIM Ref. No. 176390)--PSG6 (OMIM Ref. No. 176395)--PSG7 (OMIM Ref. No. 176396)--PSG13 (PSG11; 176401)--PSG2 (OMIM Ref. No. 176391)--PSG5 (OMIM Ref. No. 176394)--PSG4--PSG11 (PSG9; 176398)--tel. The PSG genes are tandemly oriented in a 5-prime to 3-prime direction from telomere to centromere. The CEA subgroup gene CGM11 is located at the telomeric end of the PSG gene cluster, and 6 genes belonging to a third CEA family subgroup, namely CGM13 through CGM18 (later OMIM Ref. No. 109770), are interspersed among the PSG genes. Nomenclature: Beauchemin et al. (1999) provided a revised nomenclature for the CEA gene family. Based on this nomenclature, the CEA family is composed of the PSG subfamily, the CEACAM subfamily (see OMIM Ref. No. 109770), and the CEACAM pseudogene (CEACAMP) subfamily (see OMIM Ref. No. 109770). PSG11, PSG12, and PSG13 were renamed PSG9, PSG10, and PSG11, respectively

[40985] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[40986] Beauchemin, N.; Draber, P.; Dveksler, G.; Gold, P.; Gray-Owen, S.; Grunert, F.; Hammarstrom, S.; Holmes, K. V.; Karlsson, A.; Kuroki, M.; Lin, S.-H.; Lucka, L.; and 13 others : Redefined nomenclature for members of the carcinoembryonic antigen family. *Exp. Cell Res.* 252: 243-249, 1999. ; and

[40987] Brandriff, B. F.; Gordon, L. A.; Tynan, K. T.; Olsen, A. S.; Mohrenweiser, H. W.; Fertitta, A.; Carrano, A. V.; Trask, B. J. : Order and genomic distances among members of the carcinoem.

[40988] Further studies establishing the function and utilities of PSG4 are found in John Hopkins OMIM database record ID 176393, and in cited publications numbered 2240, 10731, 10742-10740, 1074 and 10744 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Pregnancy Specific Beta-1-glycoprotein 7 (PSG7, Accession NM_002783) is another VGAM1135 host target gene. PSG7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PSG7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PSG7 BINDING SITE,

designated SEQ ID:8672, to the nucleotide sequence of VGAM1135 RNA, herein designated VGAM RNA, also designated SEQ ID:3846.

[40989] Another function of VGAM1135 is therefore inhibition of Pregnancy Specific Beta-1-glycoprotein 7 (PSG7, Accession NM_002783), a gene which function still unknown. Accordingly, utilities of VGAM1135 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PSG7. The function of PSG7 has been established by previous studies. The human pregnancy-specific glycoproteins (PSGs) are a group of molecules that are mainly produced by the placental syncytiotrophoblasts during pregnancy. PSGs comprise a subgroup of the carcinoembryonic antigen (CEA) family, which belongs to the immunoglobulin superfamily. See PSG3 (OMIM Ref. No. 176392) for additional information about PSGs. Teglund et al. (1994) found that the PSG7 gene contains 6 exons. Studies by several groups resulted in the mapping of the CEA gene family to 19q13.1-q13.2 (Thompson et al., 1990; Thompson et al., 1992; Tynan et al., 1992; Trask et al., 1993). The PSG subgroup is located telomeric of the CEA subgroup, and together they span approximately 1.1 to 1.2 Mb (Brandriff et al., 1992; Tynan et al., 1992). Us-

ing a high-resolution restriction fragment fingerprinting technique, Olsen et al. (1994) assembled 256 cosmids spanning the PSG region on 19q13.2 into a single 700-kb contig. FISH to sperm pronuclei and cosmid walking experiments indicated that this PSG contig is telomeric of CGM8 at the telomeric end of the CEA subgroup gene cluster. Detailed restriction mapping and hybridization with gene-specific probes indicated that the order of the 11 PSG genes in the contig is cen--PSG3--PSG8 (OMIM Ref. No. 176397)--PSG12 (PSG10; 176399)--PSG1 (OMIM Ref. No. 176390)--PSG6 (OMIM Ref. No. 176395)--PSG7--PSG13 (PSG11; 176401)--PSG2 (OMIM Ref. No. 176391)--PSG5 (OMIM Ref. No. 176394)--PSG4 (OMIM Ref. No. 176393)--PSG11 (PSG9; 176398)--tel. The PSG genes are tandemly oriented in a 5-prime to 3-prime direction from telomere to centromere. The CEA subgroup gene CGM11 is located at the telomeric end of the PSG gene cluster, and 6 genes belonging to a third CEA family subgroup, namely CGM13 through CGM18 (later OMIM Ref. No. 109770), are interspersed among the PSG genes. Nomenclature: Beauchemin et al. (1999) provided a revised nomenclature for the CEA gene family. Based on this nomenclature, the CEA family is composed

of the PSG subfamily, the CEACAM subfamily (see OMIM Ref. No. 109770), and the CEACAM pseudogene (CEACAMP) subfamily (see OMIM Ref. No. 109770). PSG11, PSG12, and PSG13 were renamed PSG9, PSG10, and PSG11, respectively.

[40990] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[40991] Beauchemin, N.; Draber, P.; Dveksler, G.; Gold, P.; Gray-Owen, S.; Grunert, F.; Hammarstrom, S.; Holmes, K. V.; Karlsson, A.; Kuroki, M.; Lin, S.-H.; Lucka, L.; and 13 others : Redefined nomenclature for members of the carcinoembryonic antigen family. Exp. Cell Res. 252: 243-249, 1999. ; and

[40992] Brandriff, B. F.; Gordon, L. A.; Tynan, K. T.; Olsen, A. S.; Mohrenweiser, H. W.; Fertitta, A.; Carrano, A. V.; Trask, B. J. : Order and genomic distances among members of the carcinoem.

[40993] Further studies establishing the function and utilities of PSG7 are found in John Hopkins OMIM database record ID 176396, and in cited publications numbered 2240, 10731, 10742-10740, 1074 and 10744 listed in the bibliography section hereinbelow, which are also hereby incor-

porated by reference. Protein Tyrosine Phosphatase Type IVA, Member 2 (PTP4A2, Accession NM_003479) is another VGAM1135 host target gene. PTP4A2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PTP4A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTP4A2 BINDING SITE, designated SEQ ID:9557, to the nucleotide sequence of VGAM1135 RNA, herein designated VGAM RNA, also designated SEQ ID:3846.

[40994] Another function of VGAM1135 is therefore inhibition of Protein Tyrosine Phosphatase Type IVA, Member 2 (PTP4A2, Accession NM_003479), a gene which is a protein tyrosine phosphatase which has a C-terminal prenylation site. Accordingly, utilities of VGAM1135 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTP4A2. The function of PTP4A2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM217. SMURF1 (Accession XM_166483) is another VGAM1135 host target gene. SMURF1 BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SMURF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SMURF1 BINDING SITE, designated SEQ ID:44415, to the nucleotide sequence of VGAM1135 RNA, herein designated VGAM RNA, also designated SEQ ID:3846.

[40995] Another function of VGAM1135 is therefore inhibition of SMURF1 (Accession XM_166483). Accordingly, utilities of VGAM1135 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMURF1. Syntaxin Binding Protein 1 (STXBP1, Accession NM_003165) is another VGAM1135 host target gene. STXBP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by STXBP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STXBP1 BINDING SITE, designated SEQ ID:9141, to the nucleotide sequence of VGAM1135 RNA, herein designated VGAM RNA, also designated SEQ ID:3846.

[40996] Another function of VGAM1135 is therefore inhibition of Syntaxin Binding Protein 1 (STXBP1, Accession NM_003165), a gene which may play a role in determining the specificity of intracellular fusion reactions. Accordingly, utilities of VGAM1135 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STXBP1. The function of STXBP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM708.SWAP70 (Accession XM_049197) is another VGAM1135 host target gene. SWAP70 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SWAP70, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SWAP70 BINDING SITE, designated SEQ ID:35348, to the nucleotide sequence of VGAM1135 RNA, herein designated VGAM RNA, also designated SEQ ID:3846.

[40997] Another function of VGAM1135 is therefore inhibition of SWAP70 (Accession XM_049197), a gene which is involved not only in nuclear events but also in signaling in B-cell

activation. Accordingly, utilities of VGAM1135 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SWAP70. The function of SWAP70 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1090. Transcription Factor AP-4 (activating enhancer binding protein 4) (TFAP4, Accession NM_003223) is another VGAM1135 host target gene. TFAP4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TFAP4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TFAP4 BINDING SITE, designated SEQ ID:9225, to the nucleotide sequence of VGAM1135 RNA, herein designated VGAM RNA, also designated SEQ ID:3846.

[40998] Another function of VGAM1135 is therefore inhibition of Transcription Factor AP-4 (activating enhancer binding protein 4) (TFAP4, Accession NM_003223), a gene which activates both viral and cellular genes by binding to the symmetrical dna sequence 5'-cagctg-3'. Accordingly, utilities of VGAM1135 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with TFAP4. The function of TFAP4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM175. Uncoupling Protein 2 (mitochondrial, proton carrier) (UCP2, Accession NM_003355) is another VGAM1135 host target gene. UCP2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by UCP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UCP2 BINDING SITE, designated SEQ ID:9382, to the nucleotide sequence of VGAM1135 RNA, herein designated VGAM RNA, also designated SEQ ID:3846.

[40999] Another function of VGAM1135 is therefore inhibition of Uncoupling Protein 2 (mitochondrial, proton carrier) (UCP2, Accession NM_003355), a gene which is an inner mitochondrial membrane transporter and uncouples electron transport from oxidative phosphorylation. Accordingly, utilities of VGAM1135 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UCP2. The function of UCP2 has been estab-

lished by previous studies. Esterbauer et al. (2001) showed that a common G/A polymorphism in the UCP2 promoter region is associated with enhanced adipose tissue mRNA expression in vivo and results in increased transcription of a reporter gene in the human adipocyte cell line PAZ-6. In analyzing 340 obese and 256 never-obese middle-aged subjects, they found a modest but significant reduction in obesity prevalence associated with the less-common allele. They confirmed this association in a population-based sample of 791 middle-aged subjects from the same geographic area (Salzburg, Austria). Despite its modest effect, but because of its high frequency (approximately 63%), the more-common risk allele conferred a relatively large population-attributable risk accounting for 15% of the obesity in the population studied. Animal model experiments lend further support to the function of UCP2. Zhang et al. (2001) assessed the role of UCP2 in regulating insulin secretion.

Ucp2-deficient mice had higher islet ATP levels and increased glucose-stimulated insulin secretion, establishing that UCP2 negatively regulates insulin secretion. Of pathophysiologic significance, Ucp2 was markedly upregulated in islets of ob/ob mice, a model of obesity-induced

diabetes. Ob/ob mice lacking Ucp2 had restored first-phase insulin secretion, increased serum insulin levels, and greatly decreased levels of glycemia. These results established UCP2 as a key component of beta-cell glucose sensing and as a critical link between obesity, beta-cell dysfunction, and type II diabetes.

[41000] It is appreciated that the abovementioned animal model for UCP2 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[41001] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[41002] Esterbauer, H.; Schneitler, C.; Oberkofler, H.; Ebenbichler, C.; Paulweber, B.; Sandhofer, F.; Ladurner, G.; Hell, E.; Strosberg, A. D.; Patsch, J. R.; Krempler, F.; Patsch, W. : A common polymorphism in the promoter of UCP2 is associated with decreased risk of obesity in middle-aged humans. *Nature Genet.* 28: 178–183, 2001. ; and

[41003] Zhang, C.-Y.; Baffy, G.; Perret, P.; Krauss, S.; Peroni, O.; Grujic, D.; Hagen, T.; Vidal-Puig, A.; Boss, O.; Kim, Y.-B.; Zheng, X. X.; Wheeler, M. B.; Shulman, G. I.; Chan, C. B.; Lo.

[41004] Further studies establishing the function and utilities of UCP2 are found in John Hopkins OMIM database record ID 601693, and in cited publications numbered 6483–6485, 3700–3701, 6486–6489, 279 and 6707 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. AP1 Gamma Subunit Binding Protein 1 (AP1GBP1, Accession NM_007247) is another VGAM1135 host target gene. AP1GBP1 BINDING SITE1 through AP1GBP1 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by AP1GBP1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AP1GBP1 BINDING SITE1 through AP1GBP1 BINDING SITE3, designated SEQ ID:14116, SEQ ID:27871 and SEQ ID:27879 respectively, to the nucleotide sequence of VGAM1135 RNA, herein designated VGAM RNA, also designated SEQ ID:3846.

[41005] Another function of VGAM1135 is therefore inhibition of AP1 Gamma Subunit Binding Protein 1 (AP1GBP1, Accession NM_007247). Accordingly, utilities of VGAM1135 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AP1GBP1. Chromosome

20 Open Reading Frame 173 (C20orf173, Accession NM_080828) is another VGAM1135 host target gene. C20orf173 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by C20orf173, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf173 BINDING SITE, designated SEQ ID:28093, to the nucleotide sequence of VGAM1135 RNA, herein designated VGAM RNA, also designated SEQ ID:3846.

[41006] Another function of VGAM1135 is therefore inhibition of Chromosome 20 Open Reading Frame 173 (C20orf173, Accession NM_080828). Accordingly, utilities of VGAM1135 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf173. Calneuron 1 (CALN1, Accession NM_031468) is another VGAM1135 host target gene. CALN1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CALN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

CALN1 BINDING SITE, designated SEQ ID:25513, to the nucleotide sequence of VGAM1135 RNA, herein designated VGAM RNA, also designated SEQ ID:3846.

[41007] Another function of VGAM1135 is therefore inhibition of Calneuron 1 (CALN1, Accession NM_031468). Accordingly, utilities of VGAM1135 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CALN1. Cerebellin 1 Precursor (CBLN1, Accession NM_004352) is another VGAM1135 host target gene. CBLN1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CBLN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CBLN1 BINDING SITE, designated SEQ ID:10555, to the nucleotide sequence of VGAM1135 RNA, herein designated VGAM RNA, also designated SEQ ID:3846.

[41008] Another function of VGAM1135 is therefore inhibition of Cerebellin 1 Precursor (CBLN1, Accession NM_004352). Accordingly, utilities of VGAM1135 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CBLN1. Calcium Homeostasis Endo-

plasmic Reticulum Protein (CHERP, Accession NM_006387) is another VGAM1135 host target gene. CHERP BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CHERP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHERP BINDING SITE, designated SEQ ID:13091, to the nucleotide sequence of VGAM1135 RNA, herein designated VGAM RNA, also designated SEQ ID:3846.

[41009] Another function of VGAM1135 is therefore inhibition of Calcium Homeostasis Endoplasmic Reticulum Protein (CHERP, Accession NM_006387). Accordingly, utilities of VGAM1135 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHERP. DEAD/H (Asp-Glu-Ala-Asp/His) Box Polypeptide 37 (DDX37, Accession NM_032656) is another VGAM1135 host target gene. DDX37 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DDX37, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DDX37 BINDING SITE, des-

ignated SEQ ID:26389, to the nucleotide sequence of VGAM1135 RNA, herein designated VGAM RNA, also designated SEQ ID:3846.

[41010] Another function of VGAM1135 is therefore inhibition of DEAD/H (Asp-Glu-Ala-Asp/His) Box Polypeptide 37 (DDX37, Accession NM_032656). Accordingly, utilities of VGAM1135 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DDX37. Dedicator of Cyto-kinesis 3 (DOCK3, Accession XM_039259) is another VGAM1135 host target gene. DOCK3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DOCK3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DOCK3 BINDING SITE, designated SEQ ID:33035, to the nucleotide sequence of VGAM1135 RNA, herein designated VGAM RNA, also designated SEQ ID:3846.

[41011] Another function of VGAM1135 is therefore inhibition of Dedicator of Cyto-kinesis 3 (DOCK3, Accession XM_039259). Accordingly, utilities of VGAM1135 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with DOCK3. EDR2 (Accession XM_018136) is another VGAM1135 host target gene. EDR2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EDR2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EDR2 BINDING SITE, designated SEQ ID:30341, to the nucleotide sequence of VGAM1135 RNA, herein designated VGAM RNA, also designated SEQ ID:3846.

[41012] Another function of VGAM1135 is therefore inhibition of EDR2 (Accession XM_018136). Accordingly, utilities of VGAM1135 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EDR2. Erythroblast Membrane-associated Protein (ERMAP, Accession NM_018538) is another VGAM1135 host target gene. ERMAP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ERMAP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ERMAP BINDING SITE, designated SEQ ID:20609, to the nucleotide sequence of VGAM1135 RNA,

herein designated VGAM RNA, also designated SEQ ID:3846.

[41013] Another function of VGAM1135 is therefore inhibition of Erythroblast Membrane-associated Protein (ERMAP, Accession NM_018538). Accordingly, utilities of VGAM1135 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ERMAP. FLJ12681 (Accession NM_022773) is another VGAM1135 host target gene. FLJ12681 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12681, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12681 BINDING SITE, designated SEQ ID:23037, to the nucleotide sequence of VGAM1135 RNA, herein designated VGAM RNA, also designated SEQ ID:3846.

[41014] Another function of VGAM1135 is therefore inhibition of FLJ12681 (Accession NM_022773). Accordingly, utilities of VGAM1135 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12681. FLJ12704 (Accession NM_024998) is another VGAM1135 host target gene. FLJ12704 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12704, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12704 BINDING SITE, designated SEQ ID:24567, to the nucleotide sequence of VGAM1135 RNA, herein designated VGAM RNA, also designated SEQ ID:3846.

[41015] Another function of VGAM1135 is therefore inhibition of FLJ12704 (Accession NM_024998). Accordingly, utilities of VGAM1135 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12704. FLJ22501 (Accession NM_024747) is another VGAM1135 host target gene. FLJ22501 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ22501, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22501 BINDING SITE, designated SEQ ID:24083, to the nucleotide sequence of VGAM1135 RNA, herein designated VGAM RNA, also designated SEQ ID:3846.

[41016] Another function of VGAM1135 is therefore inhibition of

FLJ22501 (Accession NM_024747). Accordingly, utilities of VGAM1135 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22501. FRAG1 (Accession NM_014489) is another VGAM1135 host target gene. FRAG1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FRAG1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FRAG1 BINDING SITE, designated SEQ ID:15834, to the nucleotide sequence of VGAM1135 RNA, herein designated VGAM RNA, also designated SEQ ID:3846.

[41017] Another function of VGAM1135 is therefore inhibition of FRAG1 (Accession NM_014489). Accordingly, utilities of VGAM1135 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FRAG1. HIP-55 (Accession NM_014063) is another VGAM1135 host target gene. HIP-55 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HIP-55, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of HIP-55 BINDING SITE, designated SEQ ID:15277, to the nucleotide sequence of VGAM1135 RNA, herein designated VGAM RNA, also designated SEQ ID:3846.

[41018] Another function of VGAM1135 is therefore inhibition of HIP-55 (Accession NM_014063). Accordingly, utilities of VGAM1135 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HIP-55. KIAA0552 (Accession NM_014731) is another VGAM1135 host target gene. KIAA0552 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0552, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0552 BINDING SITE, designated SEQ ID:16345, to the nucleotide sequence of VGAM1135 RNA, herein designated VGAM RNA, also designated SEQ ID:3846.

[41019] Another function of VGAM1135 is therefore inhibition of KIAA0552 (Accession NM_014731). Accordingly, utilities of VGAM1135 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0552. KIAA1193 (Accession XM_041843) is another

VGAM1135 host target gene. KIAA1193 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1193, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1193 BINDING SITE, designated SEQ ID:33583, to the nucleotide sequence of VGAM1135 RNA, herein designated VGAM RNA, also designated SEQ ID:3846.

[41020] Another function of VGAM1135 is therefore inhibition of KIAA1193 (Accession XM_041843). Accordingly, utilities of VGAM1135 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1193. KIAA1196 (Accession XM_028968) is another VGAM1135 host target gene. KIAA1196 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1196, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1196 BINDING SITE, designated SEQ ID:30822, to the nucleotide sequence of VGAM1135 RNA, herein designated VGAM RNA, also designated SEQ ID:3846.

[41021] Another function of VGAM1135 is therefore inhibition of KIAA1196 (Accession XM_028968). Accordingly, utilities of VGAM1135 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1196. KIAA1434 (Accession XM_045585) is another VGAM1135 host target gene. KIAA1434 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1434, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1434 BINDING SITE, designated SEQ ID:34491, to the nucleotide sequence of VGAM1135 RNA, herein designated VGAM RNA, also designated SEQ ID:3846.

[41022] Another function of VGAM1135 is therefore inhibition of KIAA1434 (Accession XM_045585). Accordingly, utilities of VGAM1135 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1434. KIAA1485 (Accession XM_114619) is another VGAM1135 host target gene. KIAA1485 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1485, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1485 BINDING SITE, designated SEQ ID:43002, to the nucleotide sequence of VGAM1135 RNA, herein designated VGAM RNA, also designated SEQ ID:3846.

[41023] Another function of VGAM1135 is therefore inhibition of KIAA1485 (Accession XM_114619). Accordingly, utilities of VGAM1135 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1485. LIM and SH3 Protein 1 (LASP1, Accession NM_006148) is another VGAM1135 host target gene. LASP1 BINDING SITE1 and LASP1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LASP1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LASP1 BINDING SITE1 and LASP1 BINDING SITE2, designated SEQ ID:12796 and SEQ ID:12803 respectively, to the nucleotide sequence of VGAM1135 RNA, herein designated VGAM RNA, also designated SEQ ID:3846.

[41024] Another function of VGAM1135 is therefore inhibition of LIM and SH3 Protein 1 (LASP1, Accession NM_006148).

Accordingly, utilities of VGAM1135 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LASP1. Sema Domain, Immunoglobulin Domain (Ig), Transmembrane Domain (TM) and Short Cytoplasmic Domain, (semaphorin) 4G (SEMA4G, Accession NM_017893) is another VGAM1135 host target gene. SEMA4G BINDING SITE1 and SEMA4G BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by SEMA4G, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEMA4G BINDING SITE1 and SEMA4G BINDING SITE2, designated SEQ ID:19565 and SEQ ID:45416 respectively, to the nucleotide sequence of VGAM1135 RNA, herein designated VGAM RNA, also designated SEQ ID:3846.

[41025] Another function of VGAM1135 is therefore inhibition of Sema Domain, Immunoglobulin Domain (Ig), Transmembrane Domain (TM) and Short Cytoplasmic Domain, (semaphorin) 4G (SEMA4G, Accession NM_017893). Accordingly, utilities of VGAM1135 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEMA4G. Tumor Protein P53 Inducible Nu-

clear Protein 1 (TP53INP1, Accession NM_033285) is another VGAM1135 host target gene. TP53INP1 BINDING SITE1 and TP53INP1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by TP53INP1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TP53INP1 BINDING SITE1 and TP53INP1 BINDING SITE2, designated SEQ ID:27110 and SEQ ID:32960 respectively, to the nucleotide sequence of VGAM1135 RNA, herein designated VGAM RNA, also designated SEQ ID:3846.

[41026] Another function of VGAM1135 is therefore inhibition of Tumor Protein P53 Inducible Nuclear Protein 1 (TP53INP1, Accession NM_033285). Accordingly, utilities of VGAM1135 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TP53INP1. LOC113444 (Accession NM_138428) is another VGAM1135 host target gene. LOC113444 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC113444, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of LOC113444 BINDING SITE, designated SEQ ID:28790, to the nucleotide sequence of VGAM1135 RNA, herein designated VGAM RNA, also designated SEQ ID:3846.

[41027] Another function of VGAM1135 is therefore inhibition of LOC113444 (Accession NM_138428). Accordingly, utilities of VGAM1135 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC113444. LOC146733 (Accession XM_097076) is another VGAM1135 host target gene. LOC146733 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC146733, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146733 BINDING SITE, designated SEQ ID:40732, to the nucleotide sequence of VGAM1135 RNA, herein designated VGAM RNA, also designated SEQ ID:3846.

[41028] Another function of VGAM1135 is therefore inhibition of LOC146733 (Accession XM_097076). Accordingly, utilities of VGAM1135 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146733. LOC146784 (Accession XM_085588) is an-

other VGAM1135 host target gene. LOC146784 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC146784, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146784 BINDING SITE, designated SEQ ID:38241, to the nucleotide sequence of VGAM1135 RNA, herein designated VGAM RNA, also designated SEQ ID:3846.

[41029] Another function of VGAM1135 is therefore inhibition of LOC146784 (Accession XM_085588). Accordingly, utilities of VGAM1135 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146784. LOC148932 (Accession XM_086372) is another VGAM1135 host target gene. LOC148932 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC148932, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148932 BINDING SITE, designated SEQ ID:38624, to the nucleotide sequence of VGAM1135 RNA, herein designated VGAM RNA, also designated SEQ ID:3846.

[41030] Another function of VGAM1135 is therefore inhibition of LOC148932 (Accession XM_086372). Accordingly, utilities of VGAM1135 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148932. LOC158263 (Accession XM_088530) is another VGAM1135 host target gene. LOC158263 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC158263, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158263 BINDING SITE, designated SEQ ID:39801, to the nucleotide sequence of VGAM1135 RNA, herein designated VGAM RNA, also designated SEQ ID:3846.

[41031] Another function of VGAM1135 is therefore inhibition of LOC158263 (Accession XM_088530). Accordingly, utilities of VGAM1135 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158263. LOC162333 (Accession XM_102591) is another VGAM1135 host target gene. LOC162333 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC162333, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC162333 BINDING SITE, designated SEQ ID:42133, to the nucleotide sequence of VGAM1135 RNA, herein designated VGAM RNA, also designated SEQ ID:3846.

[41032] Another function of VGAM1135 is therefore inhibition of LOC162333 (Accession XM_102591). Accordingly, utilities of VGAM1135 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC162333. LOC200830 (Accession XM_117287) is another VGAM1135 host target gene. LOC200830 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC200830, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200830 BINDING SITE, designated SEQ ID:43351, to the nucleotide sequence of VGAM1135 RNA, herein designated VGAM RNA, also designated SEQ ID:3846.

[41033] Another function of VGAM1135 is therefore inhibition of LOC200830 (Accession XM_117287). Accordingly, utilities of VGAM1135 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC200830. LOC219621 (Accession XM_166148) is another VGAM1135 host target gene. LOC219621 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC219621, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219621 BINDING SITE, designated SEQ ID:43969, to the nucleotide sequence of VGAM1135 RNA, herein designated VGAM RNA, also designated SEQ ID:3846.

[41034] Another function of VGAM1135 is therefore inhibition of LOC219621 (Accession XM_166148). Accordingly, utilities of VGAM1135 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219621. LOC221466 (Accession XM_168087) is another VGAM1135 host target gene. LOC221466 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC221466, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221466 BINDING SITE, designated SEQ ID:44998, to the nucleotide sequence of VGAM1135 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3846.

[41035] Another function of VGAM1135 is therefore inhibition of LOC221466 (Accession XM_168087). Accordingly, utilities of VGAM1135 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221466. LOC221833 (Accession XM_166519) is another VGAM1135 host target gene. LOC221833 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221833, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221833 BINDING SITE, designated SEQ ID:44456, to the nucleotide sequence of VGAM1135 RNA, herein designated VGAM RNA, also designated SEQ ID:3846.

[41036] Another function of VGAM1135 is therefore inhibition of LOC221833 (Accession XM_166519). Accordingly, utilities of VGAM1135 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221833. LOC254428 (Accession XM_170932) is another VGAM1135 host target gene. LOC254428 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC254428, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254428 BINDING SITE, designated SEQ ID:45719, to the nucleotide sequence of VGAM1135 RNA, herein designated VGAM RNA, also designated SEQ ID:3846.

[41037] Another function of VGAM1135 is therefore inhibition of LOC254428 (Accession XM_170932). Accordingly, utilities of VGAM1135 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254428. LOC256997 (Accession XM_170900) is another VGAM1135 host target gene. LOC256997 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC256997, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256997 BINDING SITE, designated SEQ ID:45652, to the nucleotide sequence of VGAM1135 RNA, herein designated VGAM RNA, also designated SEQ ID:3846.

[41038] Another function of VGAM1135 is therefore inhibition of LOC256997 (Accession XM_170900). Accordingly, utilities of VGAM1135 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC256997. LOC51267 (Accession NM_016511) is another VGAM1135 host target gene. LOC51267 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC51267, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51267 BINDING SITE, designated SEQ ID:18591, to the nucleotide sequence of VGAM1135 RNA, herein designated VGAM RNA, also designated SEQ ID:3846.

[41039] Another function of VGAM1135 is therefore inhibition of LOC51267 (Accession NM_016511). Accordingly, utilities of VGAM1135 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51267. LOC59346 (Accession NM_021630) is another VGAM1135 host target gene. LOC59346 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC59346, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC59346 BINDING SITE, designated SEQ ID:22272, to the

nucleotide sequence of VGAM1135 RNA, herein designated VGAM RNA, also designated SEQ ID:3846.

[41040] Another function of VGAM1135 is therefore inhibition of LOC59346 (Accession NM_021630). Accordingly, utilities of VGAM1135 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC59346. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1136 (VGAM1136) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[41041] VGAM1136 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1136 was detected is described hereinabove with reference to Figs. 1–8.

[41042] VGAM1136 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Beet Mild Yellowing Virus. VGAM1136 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[41043] VGAM1136 gene encodes a VGAM1136 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1136 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1136 precursor RNA is designated SEQ ID:1122, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1122 is located at position 1677 relative to the genome of Beet Mild Yellowing Virus.

[41044] VGAM1136 precursor RNA folds onto itself, forming VGAM1136 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[41045] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1136 folded precursor RNA into VGAM1136 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1136 RNA is designated SEQ ID:3847, and is provided hereinbelow with reference to the sequence listing part.

[41046] VGAM1136 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1136 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1136 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[41047] VGAM1136 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1136 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1136 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1136 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1136 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[41048] The complementary binding of VGAM1136 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1136 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1136 host target RNA into VGAM1136 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[41049] It is appreciated that VGAM1136 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM1136 host target genes. The mRNA of each one of this plurality of VGAM1136 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1136 RNA, herein designated VGAM RNA, and which when bound by VGAM1136 RNA causes inhibition of translation of respective one or more VGAM1136 host target proteins.

[41050] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1136 gene, herein designated VGAM GENE, on one or more VGAM1136 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science
294,779 (2001)).

[41051] It is yet further appreciated that a function of VGAM1136 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1136 include diagnosis, prevention and treatment of viral infection by Beet Mild Yellowing Virus. Specific functions, and accordingly utilities, of VGAM1136 correlate with, and may be deduced from, the identity of the host target genes which VGAM1136 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[41052] Nucleotide sequences of the VGAM1136 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1136 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1136 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1136 are further described hereinbelow with reference to Table 1.

[41053] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1136 host target RNA, and schematic representation of the complementarity of each

of these host target binding sites to VGAM1136 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[41054] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1136 gene, herein designated VGAM is inhibition of expression of VGAM1136 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1136 correlate with, and may be deduced from, the identity of the target genes which VGAM1136 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[41055] SORCS2 (Accession NM_020777) is a VGAM1136 host target gene. SORCS2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SORCS2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SORCS2 BINDING SITE, designated SEQ ID:21873, to the nucleotide sequence of VGAM1136 RNA, herein designated VGAM RNA, also designated SEQ ID:3847.

[41056] A function of VGAM1136 is therefore inhibition of SORCS2 (Accession NM_020777). Accordingly, utilities of

VGAM1136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SORCS2. Transporter 2, ATP-binding Cassette, Sub-family B (MDR/TAP) (TAP2, Accession NM_000544) is another VGAM1136 host target gene. TAP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TAP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TAP2 BINDING SITE, designated SEQ ID:6140, to the nucleotide sequence of VGAM1136 RNA, herein designated VGAM RNA, also designated SEQ ID:3847.

[41057] Another function of VGAM1136 is therefore inhibition of Transporter 2, ATP-binding Cassette, Sub-family B (MDR/TAP) (TAP2, Accession NM_000544), a gene which is involved in the transport of antigens from the cytoplasm to a membrane-bound compartment for association with mhc class i molecules. Accordingly, utilities of VGAM1136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TAP2. The function of TAP2 and its association with various diseases and clinical conditions, has been established by previous studies,

as described hereinabove with reference to VGAM55. Ras and Rab Interactor 3 (RIN3, Accession NM_024832) is another VGAM1136 host target gene. RIN3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RIN3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RIN3 BINDING SITE, designated SEQ ID:24230, to the nucleotide sequence of VGAM1136 RNA, herein designated VGAM RNA, also designated SEQ ID:3847.

[41058] Another function of VGAM1136 is therefore inhibition of Ras and Rab Interactor 3 (RIN3, Accession NM_024832). Accordingly, utilities of VGAM1136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RIN3. LOC145623 (Accession XM_096822) is another VGAM1136 host target gene. LOC145623 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145623, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145623 BINDING SITE, desig-

nated SEQ ID:40544, to the nucleotide sequence of VGAM1136 RNA, herein designated VGAM RNA, also designated SEQ ID:3847.

[41059] Another function of VGAM1136 is therefore inhibition of LOC145623 (Accession XM_096822). Accordingly, utilities of VGAM1136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145623. LOC197335 (Accession XM_113866) is another VGAM1136 host target gene. LOC197335 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC197335, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC197335 BINDING SITE, designated SEQ ID:42479, to the nucleotide sequence of VGAM1136 RNA, herein designated VGAM RNA, also designated SEQ ID:3847.

[41060] Another function of VGAM1136 is therefore inhibition of LOC197335 (Accession XM_113866). Accordingly, utilities of VGAM1136 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197335. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 1137 (VGAM1137) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[41061] VGAM1137 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1137 was detected is described hereinabove with reference to Figs. 1–8.

[41062] VGAM1137 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Beet Mild Yellowing Virus. VGAM1137 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[41063] VGAM1137 gene encodes a VGAM1137 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1137 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1137 precursor RNA is designated SEQ ID:1123, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1123 is located at position 3269 relative to the

genome of Beet Mild Yellowing Virus.

[41064] VGAM1137 precursor RNA folds onto itself, forming VGAM1137 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[41065] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1137 folded precursor RNA into VGAM1137 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 89%) nucleotide sequence of VGAM1137 RNA is designated SEQ ID:3848, and is provided hereinbelow with reference to the sequence listing part.

[41066] VGAM1137 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM1137 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1137 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[41067] VGAM1137 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1137 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1137 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1137 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1137 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[41068] The complementary binding of VGAM1137 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1137 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1137 host target RNA into VGAM1137 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[41069] It is appreciated that VGAM1137 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1137 host target genes. The mRNA of each one of this plurality of VGAM1137 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1137 RNA, herein designated VGAM RNA, and which when bound by VGAM1137 RNA causes inhibition of translation of respective one or more VGAM1137 host target proteins.

[41070] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1137 gene, herein designated VGAM GENE, on one or more VGAM1137 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[41071] It is yet further appreciated that a function of VGAM1137 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1137 include diagnosis, prevention and treatment of viral infection by Beet Mild Yellowing Virus. Specific functions, and accordingly utilities, of VGAM1137

correlate with, and may be deduced from, the identity of the host target genes which VGAM1137 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[41072] Nucleotide sequences of the VGAM1137 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1137 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1137 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1137 are further described hereinbelow with reference to Table 1.

[41073] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1137 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1137 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[41074] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1137 gene, herein designated VGAM is inhibition of expression of VGAM1137 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1137 correlate with, and may be deduced

from, the identity of the target genes which VGAM1137 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[41075] A2BP1 (Accession NM_018723) is a VGAM1137 host target gene. A2BP1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by A2BP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of A2BP1 BINDING SITE, designated SEQ ID:20804, to the nucleotide sequence of VGAM1137 RNA, herein designated VGAM RNA, also designated SEQ ID:3848.

[41076] A function of VGAM1137 is therefore inhibition of A2BP1 (Accession NM_018723). Accordingly, utilities of VGAM1137 include diagnosis, prevention and treatment of diseases and clinical conditions associated with A2BP1. NPD009 (Accession XM_170795) is another VGAM1137 host target gene. NPD009 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NPD009, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of NPD009 BINDING SITE, designated SEQ ID:45561, to the nucleotide sequence of VGAM1137 RNA, herein designated VGAM RNA, also designated SEQ ID:3848.

[41077] Another function of VGAM1137 is therefore inhibition of NPD009 (Accession XM_170795). Accordingly, utilities of VGAM1137 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NPD009. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1138 (VGAM1138) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[41078] VGAM1138 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1138 was detected is described hereinabove with reference to Figs. 1–8.

[41079] VGAM1138 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Beet Mild Yellowing Virus. VGAM1138 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in

the human genome.

[41080] VGAM1138 gene encodes a VGAM1138 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1138 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1138 precursor RNA is designated SEQ ID:1124, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1124 is located at position 1988 relative to the genome of Beet Mild Yellowing Virus.

[41081] VGAM1138 precursor RNA folds onto itself, forming VGAM1138 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[41082] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1138 folded precursor RNA into VGAM1138 RNA, herein designated VGAM RNA, a single stranded ~22

nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 58%) nucleotide sequence of VGAM1138 RNA is designated SEQ ID:3849, and is provided hereinbelow with reference to the sequence listing part.

[41083] VGAM1138 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1138 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1138 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[41084] VGAM1138 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1138 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1138 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1138 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1138 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[41085] The complementary binding of VGAM1138 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1138 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1138 host target RNA into VGAM1138 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[41086] It is appreciated that VGAM1138 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1138 host target genes. The mRNA of each one of this plurality of VGAM1138 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1138 RNA, herein designated VGAM RNA, and which when bound by VGAM1138 RNA causes inhibition of translation of respective one or more VGAM1138 host target proteins.

[41087] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1138 gene, herein designated VGAM GENE, on one or more VGAM1138 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[41088] It is yet further appreciated that a function of VGAM1138 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1138 include diagnosis, prevention and treatment of viral infection by Beet Mild Yellowing Virus. Specific functions, and accordingly utilities, of VGAM1138 correlate with, and may be deduced from, the identity of the host target genes which VGAM1138 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[41089] Nucleotide sequences of the VGAM1138 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1138 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1138 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1138 are further described hereinbelow with reference to Table 1.

[41090] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM1138 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1138 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[41091] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1138 gene, herein designated VGAM is inhibition of expression of VGAM1138 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1138 correlate with, and may be deduced from, the identity of the target genes which VGAM1138 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[41092] Adenylate Kinase 1 (AK1, Accession NM_000476) is a VGAM1138 host target gene. AK1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AK1 BINDING SITE, designated SEQ ID:6085, to the nucleotide sequence of VGAM1138 RNA, herein designated VGAM RNA, also designated SEQ ID:3849.

[41093] A function of VGAM1138 is therefore inhibition of Adenylate Kinase 1 (AK1, Accession NM_000476). Accordingly, utilities of VGAM1138 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AK1. Homeo Box D4 (HOXD4, Accession NM_014621) is another VGAM1138 host target gene. HOXD4 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by HOXD4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HOXD4 BINDING SITE, designated SEQ ID:15978, to the nucleotide sequence of VGAM1138 RNA, herein designated VGAM RNA, also designated SEQ ID:3849.

[41094] Another function of VGAM1138 is therefore inhibition of Homeo Box D4 (HOXD4, Accession NM_014621), a gene which is part of a developmental regulatory system. Accordingly, utilities of VGAM1138 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HOXD4. The function of HOXD4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM330. Kinase Insert Do-

main Receptor (a type III receptor tyrosine kinase) (KDR, Accession NM_002253) is another VGAM1138 host target gene. KDR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KDR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KDR BINDING SITE, designated SEQ ID:8052, to the nucleotide sequence of VGAM1138 RNA, herein designated VGAM RNA, also designated SEQ ID:3849.

[41095] Another function of VGAM1138 is therefore inhibition of Kinase Insert Domain Receptor (a type III receptor tyrosine kinase) (KDR, Accession NM_002253). Accordingly, utilities of VGAM1138 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KDR. Kruppel-like Factor 8 (KLF8, Accession NM_007250) is another VGAM1138 host target gene. KLF8 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KLF8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KLF8 BINDING SITE, designated SEQ ID:14124, to the nu-

cleotide sequence of VGAM1138 RNA, herein designated VGAM RNA, also designated SEQ ID:3849.

[41096] Another function of VGAM1138 is therefore inhibition of Kruppel-like Factor 8 (KLF8, Accession NM_007250). Accordingly, utilities of VGAM1138 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KLF8. MIPOL1 (Accession XM_085077) is another VGAM1138 host target gene. MIPOL1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MIPOL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MIPOL1 BINDING SITE, designated SEQ ID:37813, to the nucleotide sequence of VGAM1138 RNA, herein designated VGAM RNA, also designated SEQ ID:3849.

[41097] Another function of VGAM1138 is therefore inhibition of MIPOL1 (Accession XM_085077). Accordingly, utilities of VGAM1138 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MIPOL1. Protein Phosphatase 1, Regulatory (inhibitor) Subunit 8 (PPP1R8, Accession NM_138558) is another VGAM1138 host target gene. PPP1R8 BINDING SITE1 and

PPP1R8 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PPP1R8, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP1R8 BINDING SITE1 and PPP1R8 BINDING SITE2, designated SEQ ID:28853 and SEQ ID:8567 respectively, to the nucleotide sequence of VGAM1138 RNA, herein designated VGAM RNA, also designated SEQ ID:3849.

[41098] Another function of VGAM1138 is therefore inhibition of Protein Phosphatase 1, Regulatory (inhibitor) Subunit 8 (PPP1R8, Accession NM_138558), a gene which is an inhibitor subunit of the major nuclear protein phosphatase-1 (pp-1). Accordingly, utilities of VGAM1138 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP1R8. The function of PPP1R8 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM101. Periaxin (PRX, Accession NM_020956) is another VGAM1138 host target gene. PRX BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by PRX, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRX BINDING SITE, designated SEQ ID:21937, to the nucleotide sequence of VGAM1138 RNA, herein designated VGAM RNA, also designated SEQ ID:3849.

[41099] Another function of VGAM1138 is therefore inhibition of Periaxin (PRX, Accession NM_020956), a gene which seems to be required for maintenance of peripheral nerve myelin sheath. may have a role in axon–glial interactions, possibly by interacting with the cytoplasmic domains of integral membrane proteins such as myelin–associated glycoprotein in the periaxonal regions of the schwann cell plasma membrane. may have a role in the early phases of myelin deposition. Accordingly, utilities of VGAM1138 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRX. The function of PRX and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM476.SAR1 (Accession NM_020150) is another VGAM1138 host target gene. SAR1 BINDING SITE is HOST TARGET binding site

found in the 3' untranslated region of mRNA encoded by SAR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SAR1 BINDING SITE, designated SEQ ID:21351, to the nucleotide sequence of VGAM1138 RNA, herein designated VGAM RNA, also designated SEQ ID:3849.

[41100] Another function of VGAM1138 is therefore inhibition of SAR1 (Accession NM_020150), a gene which is involved in transport from the endoplasmic reticulum to the golgi apparatus (by similarity). Accordingly, utilities of VGAM1138 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SAR1. The function of SAR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM222.Wolf-Hirschhorn Syndrome Candidate 1 (WHSC1, Accession NM_133332) is another VGAM1138 host target gene. WHSC1 BINDING SITE1 through WHSC1 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by WHSC1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of WHSC1 BINDING SITE1 through WHSC1 BINDING SITE3, designated SEQ ID:28439, SEQ ID:28456 and SEQ ID:17175 respectively, to the nucleotide sequence of VGAM1138 RNA, herein designated VGAM RNA, also designated SEQ ID:3849.

[41101] Another function of VGAM1138 is therefore inhibition of Wolf-Hirschhorn Syndrome Candidate 1 (WHSC1, Accession NM_133332), a gene which binds covalently to and repairs g/t mismatches. Accordingly, utilities of VGAM1138 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WHSC1. The function of WHSC1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM200.C6.1A (Accession NM_024332) is another VGAM1138 host target gene. C6.1A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C6.1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C6.1A BINDING SITE, designated SEQ ID:23638, to the nucleotide sequence of

VGAM1138 RNA, herein designated VGAM RNA, also designated SEQ ID:3849.

[41102] Another function of VGAM1138 is therefore inhibition of C6.1A (Accession NM_024332). Accordingly, utilities of VGAM1138 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C6.1A. CDC14 Cell Division Cycle 14 Homolog A (*S. cerevisiae*) (CDC14A, Accession NM_003672) is another VGAM1138 host target gene. CDC14A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CDC14A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDC14A BINDING SITE, designated SEQ ID:9765, to the nucleotide sequence of VGAM1138 RNA, herein designated VGAM RNA, also designated SEQ ID:3849.

[41103] Another function of VGAM1138 is therefore inhibition of CDC14 Cell Division Cycle 14 Homolog A (*S. cerevisiae*) (CDC14A, Accession NM_003672). Accordingly, utilities of VGAM1138 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDC14A. CCR4-NOT Transcription Complex, Subunit 7

(CNOT7, Accession NM_013354) is another VGAM1138 host target gene. CNOT7 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CNOT7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CNOT7 BINDING SITE, designated SEQ ID:15002, to the nucleotide sequence of VGAM1138 RNA, herein designated VGAM RNA, also designated SEQ ID:3849.

[41104] Another function of VGAM1138 is therefore inhibition of CCR4–NOT Transcription Complex, Subunit 7 (CNOT7, Accession NM_013354). Accordingly, utilities of VGAM1138 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CNOT7. DKFZP434J193 (Accession XM_048452) is another VGAM1138 host target gene. DKFZP434J193 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP434J193, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434J193 BINDING SITE, designated SEQ ID:35166, to

the nucleotide sequence of VGAM1138 RNA, herein designated VGAM RNA, also designated SEQ ID:3849.

[41105] Another function of VGAM1138 is therefore inhibition of DKFZP434J193 (Accession XM_048452). Accordingly, utilities of VGAM1138 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434J193. DKFZp761H2121 (Accession NM_138339) is another VGAM1138 host target gene. DKFZp761H2121 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DKFZp761H2121, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp761H2121 BINDING SITE, designated SEQ ID:28738, to the nucleotide sequence of VGAM1138 RNA, herein designated VGAM RNA, also designated SEQ ID:3849.

[41106] Another function of VGAM1138 is therefore inhibition of DKFZp761H2121 (Accession NM_138339). Accordingly, utilities of VGAM1138 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761H2121. FLJ10716 (Accession NM_018191) is another VGAM1138 host target gene. FLJ10716 BIND-

ING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10716, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10716 BINDING SITE, designated SEQ ID:20044, to the nucleotide sequence of VGAM1138 RNA, herein designated VGAM RNA, also designated SEQ ID:3849.

[41107] Another function of VGAM1138 is therefore inhibition of FLJ10716 (Accession NM_018191). Accordingly, utilities of VGAM1138 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10716. FLJ10738 (Accession NM_018199) is another VGAM1138 host target gene. FLJ10738 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10738, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10738 BINDING SITE, designated SEQ ID:20068, to the nucleotide sequence of VGAM1138 RNA, herein designated VGAM RNA, also designated SEQ ID:3849.

[41108] Another function of VGAM1138 is therefore inhibition of

FLJ10738 (Accession NM_018199). Accordingly, utilities of VGAM1138 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10738. FLJ22301 (Accession NM_024836) is another VGAM1138 host target gene. FLJ22301 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ22301, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22301 BINDING SITE, designated SEQ ID:24241, to the nucleotide sequence of VGAM1138 RNA, herein designated VGAM RNA, also designated SEQ ID:3849.

[41109] Another function of VGAM1138 is therefore inhibition of FLJ22301 (Accession NM_024836). Accordingly, utilities of VGAM1138 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22301. KIAA0182 (Accession XM_050495) is another VGAM1138 host target gene. KIAA0182 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0182, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA0182 BINDING SITE, designated SEQ ID:35642, to the nucleotide sequence of VGAM1138 RNA, herein designated VGAM RNA, also designated SEQ ID:3849.

[41110] Another function of VGAM1138 is therefore inhibition of KIAA0182 (Accession XM_050495). Accordingly, utilities of VGAM1138 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0182. KIAA0494 (Accession NM_014774) is another VGAM1138 host target gene. KIAA0494 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0494, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0494 BINDING SITE, designated SEQ ID:16586, to the nucleotide sequence of VGAM1138 RNA, herein designated VGAM RNA, also designated SEQ ID:3849.

[41111] Another function of VGAM1138 is therefore inhibition of KIAA0494 (Accession NM_014774). Accordingly, utilities of VGAM1138 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0494. KIAA0660 (Accession NM_012297) is another

VGAM1138 host target gene. KIAA0660 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0660, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0660 BINDING SITE, designated SEQ ID:14656, to the nucleotide sequence of VGAM1138 RNA, herein designated VGAM RNA, also designated SEQ ID:3849.

[41112] Another function of VGAM1138 is therefore inhibition of KIAA0660 (Accession NM_012297). Accordingly, utilities of VGAM1138 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0660. RNF9 (Accession NM_052828) is another VGAM1138 host target gene. RNF9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RNF9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNF9 BINDING SITE, designated SEQ ID:27410, to the nucleotide sequence of VGAM1138 RNA, herein designated VGAM RNA, also designated SEQ ID:3849.

[41113] Another function of VGAM1138 is therefore inhibition of RNF9 (Accession NM_052828). Accordingly, utilities of VGAM1138 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNF9. LOC124222 (Accession XM_058784) is another VGAM1138 host target gene. LOC124222 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC124222, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC124222 BINDING SITE, designated SEQ ID:36741, to the nucleotide sequence of VGAM1138 RNA, herein designated VGAM RNA, also designated SEQ ID:3849.

[41114] Another function of VGAM1138 is therefore inhibition of LOC131870 (Accession XM_059544). Accordingly, utilities of VGAM1138 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC131870. LOC131870 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC131870, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC131870 BINDING SITE, designated SEQ ID:37017, to the nucleotide sequence of VGAM1138 RNA, herein designated VGAM RNA, also designated SEQ ID:3849.

[41115] Another function of VGAM1138 is therefore inhibition of LOC131870 (Accession XM_059544). Accordingly, utilities of VGAM1138 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC131870. LOC150213 (Accession XM_059324) is another VGAM1138 host target gene. LOC150213 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150213, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150213 BINDING SITE, designated SEQ ID:36959, to the nucleotide sequence of VGAM1138 RNA, herein designated VGAM RNA, also designated SEQ ID:3849.

[41116] Another function of VGAM1138 is therefore inhibition of LOC150213 (Accession XM_059324). Accordingly, utilities of VGAM1138 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC150213. LOC150236 (Accession XM_086824) is another VGAM1138 host target gene. LOC150236 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150236, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150236 BINDING SITE, designated SEQ ID:38905, to the nucleotide sequence of VGAM1138 RNA, herein designated VGAM RNA, also designated SEQ ID:3849.

[41117] Another function of VGAM1138 is therefore inhibition of LOC150236 (Accession XM_086824). Accordingly, utilities of VGAM1138 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150236. LOC220840 (Accession XM_165514) is another VGAM1138 host target gene. LOC220840 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC220840, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220840 BINDING SITE, designated SEQ ID:43658, to the nucleotide sequence of VGAM1138 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3849.

[41118] Another function of VGAM1138 is therefore inhibition of LOC220840 (Accession XM_165514). Accordingly, utilities of VGAM1138 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220840. LOC221914 (Accession XM_168232) is another VGAM1138 host target gene. LOC221914 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221914, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221914 BINDING SITE, designated SEQ ID:45099, to the nucleotide sequence of VGAM1138 RNA, herein designated VGAM RNA, also designated SEQ ID:3849.

[41119] Another function of VGAM1138 is therefore inhibition of LOC221914 (Accession XM_168232). Accordingly, utilities of VGAM1138 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221914. LOC257277 (Accession XM_170867) is another VGAM1138 host target gene. LOC257277 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC257277, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257277 BINDING SITE, designated SEQ ID:45640, to the nucleotide sequence of VGAM1138 RNA, herein designated VGAM RNA, also designated SEQ ID:3849.

[41120] Another function of VGAM1138 is therefore inhibition of LOC257277 (Accession XM_170867). Accordingly, utilities of VGAM1138 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257277. LOC91464 (Accession XM_038589) is another VGAM1138 host target gene. LOC91464 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91464, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91464 BINDING SITE, designated SEQ ID:32872, to the nucleotide sequence of VGAM1138 RNA, herein designated VGAM RNA, also designated SEQ ID:3849.

[41121] Another function of VGAM1138 is therefore inhibition of LOC91464 (Accession XM_038589). Accordingly, utilities of VGAM1138 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC91464. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1139 (VGAM1139) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[41122] VGAM1139 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1139 was detected is described hereinabove with reference to Figs. 1–8.

[41123] VGAM1139 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Chayote Mosaic Tymovirus. VGAM1139 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[41124] VGAM1139 gene encodes a VGAM1139 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1139 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1139 precursor RNA is desig-

nated SEQ ID:1125, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1125 is located at position 4987 relative to the genome of Chayote Mosaic Tymovirus.

- [41125] VGAM1139 precursor RNA folds onto itself, forming VGAM1139 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [41126] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1139 folded precursor RNA into VGAM1139 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of VGAM1139 RNA is designated SEQ ID:3850, and is provided hereinbelow with reference to the sequence

listing part.

[41127] VGAM1139 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1139 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1139 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[41128] VGAM1139 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1139 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1139 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1139 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM1139 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[41129] The complementary binding of VGAM1139 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1139 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1139 host target RNA into VGAM1139 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[41130] It is appreciated that VGAM1139 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1139 host target genes. The mRNA of each one of this plurality of VGAM1139 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1139 RNA, herein designated VGAM

RNA, and which when bound by VGAM1139 RNA causes inhibition of translation of respective one or more VGAM1139 host target proteins.

[41131] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1139 gene, herein designated VGAM GENE, on one or more VGAM1139 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[41132] It is yet further appreciated that a function of VGAM1139 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM1139 include diagnosis, prevention and treatment of viral infection by Chayote Mosaic Tymovirus. Specific functions, and accordingly utilities, of VGAM1139 correlate with, and may be deduced from, the identity of the host target genes which VGAM1139 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[41133] Nucleotide sequences of the VGAM1139 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1139 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1139 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1139 are further described hereinbelow with reference to Table 1.

[41134] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1139 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1139 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[41135] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1139 gene, herein designated VGAM is

inhibition of expression of VGAM1139 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1139 correlate with, and may be deduced from, the identity of the target genes which VGAM1139 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[41136] Chromosome 20 Open Reading Frame 36 (C20orf36, Accession NM_018257) is a VGAM1139 host target gene. C20orf36 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C20orf36, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf36 BINDING SITE, designated SEQ ID:20221, to the nucleotide sequence of VGAM1139 RNA, herein designated VGAM RNA, also designated SEQ ID:3850.

[41137] A function of VGAM1139 is therefore inhibition of Chromosome 20 Open Reading Frame 36 (C20orf36, Accession NM_018257). Accordingly, utilities of VGAM1139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf36. DKFZp586I021 (Accession NM_032271) is another VGAM1139 host target

gene. DKFZp586I021 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DKFZp586I021, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp586I021 BINDING SITE, designated SEQ ID:26027, to the nucleotide sequence of VGAM1139 RNA, herein designated VGAM RNA, also designated SEQ ID:3850.

[41138] Another function of VGAM1139 is therefore inhibition of DKFZp586I021 (Accession NM_032271). Accordingly, utilities of VGAM1139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp586I021. LOC154834 (Accession XM_098621) is another VGAM1139 host target gene. LOC154834 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC154834, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154834 BINDING SITE, designated SEQ ID:41732, to the nucleotide sequence of VGAM1139 RNA, herein designated VGAM RNA, also designated SEQ

ID:3850.

[41139] Another function of VGAM1139 is therefore inhibition of LOC154834 (Accession XM_098621). Accordingly, utilities of VGAM1139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154834. LOC169026 (Accession XM_095471) is another VGAM1139 host target gene. LOC169026 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC169026, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC169026 BINDING SITE, designated SEQ ID:40261, to the nucleotide sequence of VGAM1139 RNA, herein designated VGAM RNA, also designated SEQ ID:3850.

[41140] Another function of VGAM1139 is therefore inhibition of LOC169026 (Accession XM_095471). Accordingly, utilities of VGAM1139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC169026. LOC201292 (Accession XM_113949) is another VGAM1139 host target gene. LOC201292 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC201292, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201292 BINDING SITE, designated SEQ ID:42563, to the nucleotide sequence of VGAM1139 RNA, herein designated VGAM RNA, also designated SEQ ID:3850.

[41141] Another function of VGAM1139 is therefore inhibition of LOC201292 (Accession XM_113949). Accordingly, utilities of VGAM1139 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201292. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1140 (VGAM1140) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[41142] VGAM1140 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1140 was detected is described hereinabove with reference to Figs. 1-8.

[41143] VGAM1140 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Chayote Mosaic Ty-

movirus. VGAM1140 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[41144] VGAM1140 gene encodes a VGAM1140 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1140 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1140 precursor RNA is designated SEQ ID:1126, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1126 is located at position 709 relative to the genome of Chayote Mosaic Tymovirus.

[41145] VGAM1140 precursor RNA folds onto itself, forming VGAM1140 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[41146] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM1140 folded precursor RNA into VGAM1140 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1140 RNA is designated SEQ ID:3851, and is provided hereinbelow with reference to the sequence listing part.

[41147] VGAM1140 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1140 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1140 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[41148] VGAM1140 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1140 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM1140 RNA is an accurate or a partial inversed–reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1140 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1140 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[41149] The complementary binding of VGAM1140 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1140 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1140 host target RNA into VGAM1140 host target protein,

herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[41150] It is appreciated that VGAM1140 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1140 host target genes. The mRNA of each one of this plurality of VGAM1140 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1140 RNA, herein designated VGAM RNA, and which when bound by VGAM1140 RNA causes inhibition of translation of respective one or more VGAM1140 host target proteins.

[41151] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1140 gene, herein designated VGAM GENE, on one or more VGAM1140 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[41152] It is yet further appreciated that a function of VGAM1140 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1140 include diagnosis, prevention and treatment of viral infection by Chayote Mosaic Tymovirus. Specific functions, and accordingly utilities, of VGAM1140 correlate with, and may be deduced from, the identity of the host target genes which VGAM1140 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[41153] Nucleotide sequences of the VGAM1140 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1140 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1140 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1140 are further described hereinbelow with reference to Table 1.

[41154] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1140 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1140 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[41155] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1140 gene, herein designated VGAM is inhibition of expression of VGAM1140 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1140 correlate with, and may be deduced from, the identity of the target genes which VGAM1140 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[41156] ATPase, Class VI, Type 11A (ATP11A, Accession XM_085028) is a VGAM1140 host target gene. ATP11A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ATP11A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP11A BINDING SITE, designated SEQ ID:37800, to the

nucleotide sequence of VGAM1140 RNA, herein designated VGAM RNA, also designated SEQ ID:3851.

[41157] A function of VGAM1140 is therefore inhibition of ATPase, Class VI, Type 11A (ATP11A, Accession XM_085028). Accordingly, utilities of VGAM1140 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP11A. FLJ22056 (Accession NM_022489) is another VGAM1140 host target gene. FLJ22056 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ22056, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22056 BINDING SITE, designated SEQ ID:22868, to the nucleotide sequence of VGAM1140 RNA, herein designated VGAM RNA, also designated SEQ ID:3851.

[41158] Another function of VGAM1140 is therefore inhibition of FLJ22056 (Accession NM_022489). Accordingly, utilities of VGAM1140 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22056. LOC253461 (Accession XM_172341) is another VGAM1140 host target gene. LOC253461 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC253461, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253461 BINDING SITE, designated SEQ ID:46073, to the nucleotide sequence of VGAM1140 RNA, herein designated VGAM RNA, also designated SEQ ID:3851.

[41159] Another function of VGAM1140 is therefore inhibition of LOC253461 (Accession XM_172341). Accordingly, utilities of VGAM1140 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253461. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1141 (VGAM1141) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[41160] VGAM1141 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1141 was detected is described hereinabove with reference to Figs. 1-8.

[41161] VGAM1141 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Chayote Mosaic Ty-movirus. VGAM1141 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[41162] VGAM1141 gene encodes a VGAM1141 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1141 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1141 precursor RNA is designated SEQ ID:1127, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1127 is located at position 1116 relative to the genome of Chayote Mosaic Tymovirus.

[41163] VGAM1141 precursor RNA folds onto itself, forming VGAM1141 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence

of the nucleotide sequence of the second half thereof.

[41164] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1141 folded precursor RNA into VGAM1141 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1141 RNA is designated SEQ ID:3852, and is provided hereinbelow with reference to the sequence listing part.

[41165] VGAM1141 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1141 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1141 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[41166] VGAM1141 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1141 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1141 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1141 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1141 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[41167] The complementary binding of VGAM1141 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1141 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM1141 host target RNA into VGAM1141 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[41168] It is appreciated that VGAM1141 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1141 host target genes. The mRNA of each one of this plurality of VGAM1141 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1141 RNA, herein designated VGAM RNA, and which when bound by VGAM1141 RNA causes inhibition of translation of respective one or more VGAM1141 host target proteins.

[41169] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1141 gene, herein designated VGAM GENE, on one or more VGAM1141 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[41170] It is yet further appreciated that a function of VGAM1141 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1141 include diagnosis, prevention and treatment of viral infection by Chayote Mosaic Tymovirus. Specific functions, and accordingly utilities, of VGAM1141 correlate with, and may be deduced from, the identity of the host target genes which VGAM1141 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[41171] Nucleotide sequences of the VGAM1141 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1141 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1141 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM1141 are further described hereinbelow with reference to Table 1.

[41172] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1141 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1141 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[41173] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1141 gene, herein designated VGAM is inhibition of expression of VGAM1141 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1141 correlate with, and may be deduced from, the identity of the target genes which VGAM1141 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[41174] Transient Receptor Potential Cation Channel, Subfamily C, Member 6 (TRPC6, Accession NM_004621) is a VGAM1141 host target gene. TRPC6 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by TRPC6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRPC6 BINDING SITE, designated SEQ ID:10975, to the nucleotide sequence of VGAM1141 RNA, herein designated VGAM RNA, also designated SEQ ID:3852.

[41175] A function of VGAM1141 is therefore inhibition of Transient Receptor Potential Cation Channel, Subfamily C, Member 6 (TRPC6, Accession NM_004621), a gene which has calcium channel activity. Accordingly, utilities of VGAM1141 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRPC6. The function of TRPC6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM25. NTT73 (Accession NM_018057) is another VGAM1141 host target gene. NTT73 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by NTT73, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NTT73 BINDING SITE, designated SEQ ID:19820, to the nucleotide sequence of VGAM1141 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:3852.

[41176] Another function of VGAM1141 is therefore inhibition of NTT73 (Accession NM_018057). Accordingly, utilities of VGAM1141 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NTT73. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1142 (VGAM1142) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[41177] VGAM1142 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1142 was detected is described hereinabove with reference to Figs. 1–8.

[41178] VGAM1142 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bamboo Mosaic Virus. VGAM1142 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[41179] VGAM1142 gene encodes a VGAM1142 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes,

VGAM1142 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1142 precursor RNA is designated SEQ ID:1128, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1128 is located at position 5891 relative to the genome of Bamboo Mosaic Virus.

- [41180] VGAM1142 precursor RNA folds onto itself, forming VGAM1142 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [41181] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1142 folded precursor RNA into VGAM1142 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 45%) nucleotide sequence of VGAM1142 RNA is designated SEQ ID:3853, and is provided hereinbelow with reference to the sequence listing part.

[41182] VGAM1142 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1142 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1142 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[41183] VGAM1142 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1142 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1142 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1142 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1142 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[41184] The complementary binding of VGAM1142 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1142 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1142 host target RNA into VGAM1142 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[41185] It is appreciated that VGAM1142 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1142 host target genes. The mRNA of each one of this plurality of VGAM1142 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1142 RNA, herein designated VGAM RNA, and which when bound by VGAM1142 RNA causes inhibition of translation of respective one or more VGAM1142 host target proteins.

[41186] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1142 gene, herein designated VGAM GENE, on one or more VGAM1142 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[41187] It is yet further appreciated that a function of VGAM1142 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1142 include diagnosis, prevention and treatment of viral infection by Bamboo Mosaic Virus. Specific functions, and accordingly utilities, of VGAM1142 correlate with, and may be deduced from, the identity of the host target genes which VGAM1142 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[41188] Nucleotide sequences of the VGAM1142 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1142 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1142 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1142 are further described hereinbelow with reference to Table 1.

[41189] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1142 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1142 RNA, herein designated VGAM RNA, are described hereinbelow

with reference to Table 2.

[41190] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1142 gene, herein designated VGAM is inhibition of expression of VGAM1142 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1142 correlate with, and may be deduced from, the identity of the target genes which VGAM1142 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[41191] LanC Lantibiotic Synthetase Component C-like 1 (bacterial) (LANCL1, Accession NM_006055) is a VGAM1142 host target gene. LANCL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LANCL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LANCL1 BINDING SITE, designated SEQ ID:12692, to the nucleotide sequence of VGAM1142 RNA, herein designated VGAM RNA, also designated SEQ ID:3853.

[41192] A function of VGAM1142 is therefore inhibition of LanC Lantibiotic Synthetase Component C-like 1 (bacterial) (LANCL1, Accession NM_006055), a gene which binds the

C-terminus of stomatin. Accordingly, utilities of VGAM1142 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LANCL1. The function of LANCL1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM656. Protocadherin 9 (PCDH9, Accession XM_096054) is another VGAM1142 host target gene. PCDH9 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PCDH9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDH9 BINDING SITE, designated SEQ ID:40294, to the nucleotide sequence of VGAM1142 RNA, herein designated VGAM RNA, also designated SEQ ID:3853.

[41193] Another function of VGAM1142 is therefore inhibition of Protocadherin 9 (PCDH9, Accession XM_096054). Accordingly, utilities of VGAM1142 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDH9. Regulatory Factor X, 5 (influences HLA class II expression) (RFX5, Accession NM_000449) is an-

other VGAM1142 host target gene. RFX5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RFX5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RFX5 BINDING SITE, designated SEQ ID:6048, to the nucleotide sequence of VGAM1142 RNA, herein designated VGAM RNA, also designated SEQ ID:3853.

[41194] Another function of VGAM1142 is therefore inhibition of Regulatory Factor X, 5 (influences HLA class II expression) (RFX5, Accession NM_000449), a gene which activates transcription from class ii mhc promoters. Accordingly, utilities of VGAM1142 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RFX5. The function of RFX5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM55. Chromosome 17 Open Reading Frame 26 (C17orf26, Accession NM_139177) is another VGAM1142 host target gene. C17orf26 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C17orf26, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C17orf26 BINDING SITE, designated SEQ ID:29183, to the nucleotide sequence of VGAM1142 RNA, herein designated VGAM RNA, also designated SEQ ID:3853.

[41195] Another function of VGAM1142 is therefore inhibition of Chromosome 17 Open Reading Frame 26 (C17orf26, Accession NM_139177). Accordingly, utilities of VGAM1142 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C17orf26. Calcium-binding tyrosine-(Y)-phosphorylation Regulated (fibrousheathin 2) (CABYR, Accession NM_012189) is another VGAM1142 host target gene. CABYR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CABYR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CABYR BINDING SITE, designated SEQ ID:14476, to the nucleotide sequence of VGAM1142 RNA, herein designated VGAM RNA, also designated SEQ ID:3853.

[41196] Another function of VGAM1142 is therefore inhibition of

Calcium-binding tyrosine-(Y)-phosphorylation Regulated (fibrousheathin 2) (CABYR, Accession NM_012189). Accordingly, utilities of VGAM1142 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CABYR. FLJ10579 (Accession NM_018145) is another VGAM1142 host target gene. FLJ10579 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10579, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10579 BINDING SITE, designated SEQ ID:19944, to the nucleotide sequence of VGAM1142 RNA, herein designated VGAM RNA, also designated SEQ ID:3853.

[41197] Another function of VGAM1142 is therefore inhibition of FLJ10579 (Accession NM_018145). Accordingly, utilities of VGAM1142 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10579. FLJ11618 (Accession NM_022452) is another VGAM1142 host target gene. FLJ11618 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ11618, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11618 BINDING SITE, designated SEQ ID:22790, to the nucleotide sequence of VGAM1142 RNA, herein designated VGAM RNA, also designated SEQ ID:3853.

[41198] Another function of VGAM1142 is therefore inhibition of FLJ11618 (Accession NM_022452). Accordingly, utilities of VGAM1142 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11618. Huntingtin-associated Protein Interacting Protein (duo) (HAPIP, Accession NM_003947) is another VGAM1142 host target gene. HAPIP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HAPIP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HAPIP BINDING SITE, designated SEQ ID:10066, to the nucleotide sequence of VGAM1142 RNA, herein designated VGAM RNA, also designated SEQ ID:3853.

[41199] Another function of VGAM1142 is therefore inhibition of Huntingtin-associated Protein Interacting Protein (duo) (HAPIP, Accession NM_003947). Accordingly, utilities of

VGAM1142 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HAPIP. KIAA0515 (Accession XM_033380) is another VGAM1142 host target gene. KIAA0515 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0515, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0515 BINDING SITE, designated SEQ ID:31915, to the nucleotide sequence of VGAM1142 RNA, herein designated VGAM RNA, also designated SEQ ID:3853.

[41200] Another function of VGAM1142 is therefore inhibition of KIAA0515 (Accession XM_033380). Accordingly, utilities of VGAM1142 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0515. NPD009 (Accession XM_170795) is another VGAM1142 host target gene. NPD009 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by NPD009, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NPD009

BINDING SITE, designated SEQ ID:45559, to the nucleotide sequence of VGAM1142 RNA, herein designated VGAM RNA, also designated SEQ ID:3853.

[41201] Another function of VGAM1142 is therefore inhibition of NPD009 (Accession XM_170795). Accordingly, utilities of VGAM1142 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NPD009. Pellino Homolog 2 (Drosophila) (PELI2, Accession NM_021255) is another VGAM1142 host target gene. PELI2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PELI2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PELI2 BINDING SITE, designated SEQ ID:22227, to the nucleotide sequence of VGAM1142 RNA, herein designated VGAM RNA, also designated SEQ ID:3853.

[41202] Another function of VGAM1142 is therefore inhibition of Pellino Homolog 2 (Drosophila) (PELI2, Accession NM_021255). Accordingly, utilities of VGAM1142 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PELI2. LOC116411 (Accession XM_058095) is another VGAM1142 host target

gene. LOC116411 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC116411, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC116411 BINDING SITE, designated SEQ ID:36563, to the nucleotide sequence of VGAM1142 RNA, herein designated VGAM RNA, also designated SEQ ID:3853.

[41203] Another function of VGAM1142 is therefore inhibition of LOC116411 (Accession XM_058095). Accordingly, utilities of VGAM1142 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC116411. LOC51094 (Accession NM_015999) is another VGAM1142 host target gene. LOC51094 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC51094, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51094 BINDING SITE, designated SEQ ID:18088, to the nucleotide sequence of VGAM1142 RNA, herein designated VGAM RNA, also designated SEQ ID:3853.

[41204] Another function of VGAM1142 is therefore inhibition of LOC51094 (Accession NM_015999). Accordingly, utilities of VGAM1142 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51094. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1143 (VGAM1143) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[41205] VGAM1143 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1143 was detected is described hereinabove with reference to Figs. 1–8.

[41206] VGAM1143 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bamboo Mosaic Virus. VGAM1143 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[41207] VGAM1143 gene encodes a VGAM1143 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes,

VGAM1143 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1143 precursor RNA is designated SEQ ID:1129, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1129 is located at position 1369 relative to the genome of Bamboo Mosaic Virus.

[41208] VGAM1143 precursor RNA folds onto itself, forming VGAM1143 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[41209] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1143 folded precursor RNA into VGAM1143 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1143 RNA is designated SEQ ID:3854, and is provided hereinbelow with reference to the sequence listing part.

[41210] VGAM1143 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1143 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1143 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[41211] VGAM1143 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1143 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1143 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1143 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1143 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[41212] The complementary binding of VGAM1143 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1143 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1143 host target RNA into VGAM1143 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[41213] It is appreciated that VGAM1143 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1143 host target genes. The mRNA of each one of this plurality of VGAM1143 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1143 RNA, herein designated VGAM RNA, and which when bound by VGAM1143 RNA causes inhibition of translation of respective one or more VGAM1143 host target proteins.

[41214] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1143 gene, herein designated VGAM GENE, on one or more VGAM1143 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[41215] It is yet further appreciated that a function of VGAM1143 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1143 include diagnosis, prevention and treatment of viral infection by Bamboo Mosaic Virus. Specific functions, and accordingly utilities, of VGAM1143 correlate with, and may be deduced from, the identity of the host target genes which VGAM1143 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[41216] Nucleotide sequences of the VGAM1143 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1143 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1143 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1143 are further described hereinbelow with reference to Table 1.

[41217] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1143 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1143 RNA, herein designated VGAM RNA, are described hereinbelow

with reference to Table 2.

[41218] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1143 gene, herein designated VGAM is inhibition of expression of VGAM1143 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1143 correlate with, and may be deduced from, the identity of the target genes which VGAM1143 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[41219] Extracellular Matrix Protein 2, Female Organ and Adipocyte Specific (ECM2, Accession NM_001393) is a VGAM1143 host target gene. ECM2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ECM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ECM2 BINDING SITE, designated SEQ ID:7085, to the nucleotide sequence of VGAM1143 RNA, herein designated VGAM RNA, also designated SEQ ID:3854.

[41220] A function of VGAM1143 is therefore inhibition of Extracellular Matrix Protein 2, Female Organ and Adipocyte Specific (ECM2, Accession NM_001393). Accordingly, utili-

ties of VGAM1143 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ECM2. G Protein-coupled Receptor, Family C, Group 5, Member B (GPRC5B, Accession NM_016235) is another VGAM1143 host target gene. GPRC5B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GPRC5B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GPRC5B BINDING SITE, designated SEQ ID:18348, to the nucleotide sequence of VGAM1143 RNA, herein designated VGAM RNA, also designated SEQ ID:3854.

[41221] Another function of VGAM1143 is therefore inhibition of G Protein-coupled Receptor, Family C, Group 5, Member B (GPRC5B, Accession NM_016235), a gene which belongs to G protein-coupled receptor. Accordingly, utilities of VGAM1143 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPRC5B. The function of GPRC5B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM131. Leukocyte Immunoglobulin-like

Receptor, Subfamily B (with TM and ITIM domains), Member 4 (LILRB4, Accession NM_006847) is another VGAM1143 host target gene. LILRB4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LILRB4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LILRB4 BINDING SITE, designated SEQ ID:13716, to the nucleotide sequence of VGAM1143 RNA, herein designated VGAM RNA, also designated SEQ ID:3854.

[41222] Another function of VGAM1143 is therefore inhibition of Leukocyte Immunoglobulin-like Receptor, Subfamily B (with TM and ITIM domains), Member 4 (LILRB4, Accession NM_006847). Accordingly, utilities of VGAM1143 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LILRB4. KIAA1161 (Accession XM_088501) is another VGAM1143 host target gene. KIAA1161 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1161, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nu-

cleotide sequences of KIAA1161 BINDING SITE, designated SEQ ID:39749, to the nucleotide sequence of VGAM1143 RNA, herein designated VGAM RNA, also designated SEQ ID:3854.

[41223] Another function of VGAM1143 is therefore inhibition of KIAA1161 (Accession XM_088501). Accordingly, utilities of VGAM1143 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1161. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1144 (VGAM1144) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[41224] VGAM1144 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1144 was detected is described hereinabove with reference to Figs. 1–8.

[41225] VGAM1144 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bamboo Mosaic Virus. VGAM1144 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[41226] VGAM1144 gene encodes a VGAM1144 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1144 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1144 precursor RNA is designated SEQ ID:1130, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1130 is located at position 502 relative to the genome of Bamboo Mosaic Virus.

[41227] VGAM1144 precursor RNA folds onto itself, forming VGAM1144 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[41228] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1144 folded precursor RNA into VGAM1144 RNA, herein designated VGAM RNA, a single stranded ~22

nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1144 RNA is designated SEQ ID:3855, and is provided hereinbelow with reference to the sequence listing part.

[41229] VGAM1144 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1144 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1144 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[41230] VGAM1144 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1144 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1144 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1144 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1144 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[41231] The complementary binding of VGAM1144 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1144 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1144 host target RNA into VGAM1144 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[41232] It is appreciated that VGAM1144 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1144 host target genes. The mRNA of each one of this plurality of VGAM1144 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1144 RNA, herein designated VGAM RNA, and which when bound by VGAM1144 RNA causes inhibition of translation of respective one or more VGAM1144 host target proteins.

[41233] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1144 gene, herein designated VGAM GENE, on one or more VGAM1144 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[41234] It is yet further appreciated that a function of VGAM1144 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1144 include diagnosis, prevention and treatment of viral infection by Bamboo Mosaic Virus. Specific functions, and accordingly utilities, of VGAM1144 correlate with, and may be deduced from, the identity of the host target genes which VGAM1144 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[41235] Nucleotide sequences of the VGAM1144 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1144 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1144 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1144 are further described hereinbelow with reference to Table 1.

[41236] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM1144 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1144 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[41237] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1144 gene, herein designated VGAM is inhibition of expression of VGAM1144 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1144 correlate with, and may be deduced from, the identity of the target genes which VGAM1144 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[41238] Cyclin F (CCNF, Accession NM_001761) is a VGAM1144 host target gene. CCNF BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CCNF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CCNF BINDING SITE, designated SEQ ID:7522, to the nucleotide sequence of VGAM1144 RNA, herein designated VGAM RNA, also designated SEQ ID:3855.

[41239] A function of VGAM1144 is therefore inhibition of Cyclin F (CCNF, Accession NM_001761), a gene which likely to be involved in the control of the cell cycle during s phase and g2. Accordingly, utilities of VGAM1144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CCNF. The function of CCNF and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM367. TAF7-like RNA Polymerase II, TATA Box Binding Protein (TBP)-associated Factor, 50kDa (TAF7L, Accession NM_024885) is another VGAM1144 host target gene. TAF7L BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TAF7L, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TAF7L BINDING SITE, designated SEQ ID:24339, to the nucleotide sequence of VGAM1144 RNA, herein designated VGAM RNA, also designated SEQ ID:3855.

[41240] Another function of VGAM1144 is therefore inhibition of TAF7-like RNA Polymerase II, TATA Box Binding Protein (TBP)-associated Factor, 50kDa (TAF7L, Accession

NM_024885). Accordingly, utilities of VGAM1144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TAF7L. Fer-1-like 4 (C. elegans) (FER1L4, Accession NM_025206) is another VGAM1144 host target gene. FER1L4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FER1L4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FER1L4 BINDING SITE, designated SEQ ID:24871, to the nucleotide sequence of VGAM1144 RNA, herein designated VGAM RNA, also designated SEQ ID:3855.

[41241] Another function of VGAM1144 is therefore inhibition of Fer-1-like 4 (C. elegans) (FER1L4, Accession NM_025206). Accordingly, utilities of VGAM1144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FER1L4. KIAA0040 (Accession NM_014656) is another VGAM1144 host target gene. KIAA0040 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0040, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0040 BINDING SITE, designated SEQ ID:16094, to the nucleotide sequence of VGAM1144 RNA, herein designated VGAM RNA, also designated SEQ ID:3855.

[41242] Another function of VGAM1144 is therefore inhibition of KIAA0040 (Accession NM_014656). Accordingly, utilities of VGAM1144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0040. LHX6 (Accession NM_014368) is another VGAM1144 host target gene. LHX6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LHX6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LHX6 BINDING SITE, designated SEQ ID:15697, to the nucleotide sequence of VGAM1144 RNA, herein designated VGAM RNA, also designated SEQ ID:3855.

[41243] Another function of VGAM1144 is therefore inhibition of LHX6 (Accession NM_014368). Accordingly, utilities of VGAM1144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LHX6.

LOC160414 (Accession XM_100898) is another VGAM1144 host target gene. LOC160414 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC160414, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC160414 BINDING SITE, designated SEQ ID:42106, to the nucleotide sequence of VGAM1144 RNA, herein designated VGAM RNA, also designated SEQ ID:3855.

[41244] Another function of VGAM1144 is therefore inhibition of LOC160414 (Accession XM_100898). Accordingly, utilities of VGAM1144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC160414. LOC51716 (Accession NM_016280) is another VGAM1144 host target gene. LOC51716 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51716, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51716 BINDING SITE, designated SEQ ID:18403, to the nucleotide sequence of VGAM1144 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3855.

[41245] Another function of VGAM1144 is therefore inhibition of LOC51716 (Accession NM_016280). Accordingly, utilities of VGAM1144 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51716. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1145 (VGAM1145) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[41246] VGAM1145 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1145 was detected is described hereinabove with reference to Figs. 1–8.

[41247] VGAM1145 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bamboo Mosaic Virus. VGAM1145 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[41248] VGAM1145 gene encodes a VGAM1145 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM1145 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1145 precursor RNA is designated SEQ ID:1131, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1131 is located at position 5368 relative to the genome of Bamboo Mosaic Virus.

- [41249] VGAM1145 precursor RNA folds onto itself, forming VGAM1145 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [41250] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1145 folded precursor RNA into VGAM1145 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM1145 RNA is designated SEQ ID:3856, and is provided hereinbelow with reference to the sequence listing part.

[41251] VGAM1145 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1145 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1145 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[41252] VGAM1145 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1145 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1145 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1145 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1145 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[41253] The complementary binding of VGAM1145 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1145 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1145 host target RNA into VGAM1145 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[41254] It is appreciated that VGAM1145 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1145 host target genes. The mRNA of

each one of this plurality of VGAM1145 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1145 RNA, herein designated VGAM RNA, and which when bound by VGAM1145 RNA causes inhibition of translation of respective one or more VGAM1145 host target proteins.

[41255] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1145 gene, herein designated VGAM GENE, on one or more VGAM1145 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[41256] It is yet further appreciated that a function of VGAM1145 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1145 include diagnosis, prevention and treatment of viral infection by Bamboo Mosaic Virus. Specific functions, and accordingly utilities, of VGAM1145 correlate with, and may be deduced from, the identity of the host target genes which VGAM1145 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[41257] Nucleotide sequences of the VGAM1145 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1145 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1145 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1145 are further described hereinbelow with reference to Table 1.

[41258] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1145 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1145 RNA,

herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[41259] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1145 gene, herein designated VGAM is inhibition of expression of VGAM1145 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1145 correlate with, and may be deduced from, the identity of the target genes which VGAM1145 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[41260] UDP-GlcNAc:betaGal Beta-1,3-N-acetylglucosaminyltransferase 7 (B3GNT7, Accession XM_048735) is a VGAM1145 host target gene. B3GNT7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by B3GNT7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of B3GNT7 BINDING SITE, designated SEQ ID:35238, to the nucleotide sequence of VGAM1145 RNA, herein designated VGAM RNA, also designated SEQ ID:3856.

[41261] A function of VGAM1145 is therefore inhibition of UDP-

GlcNAc:betaGal Beta-1,3-N-acetylglucosaminyltransferase 7 (B3GNT7, Accession XM_048735). Accordingly, utilities of VGAM1145 include diagnosis, prevention and treatment of diseases and clinical conditions associated with B3GNT7. Carbohydrate (N-acetylglucosamine 6-O) Sulfo-transferase 4 (CHST4, Accession NM_005769) is another VGAM1145 host target gene. CHST4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CHST4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHST4 BINDING SITE, designated SEQ ID:12338, to the nucleotide sequence of VGAM1145 RNA, herein designated VGAM RNA, also designated SEQ ID:3856.

[41262] Another function of VGAM1145 is therefore inhibition of Carbohydrate (N-acetylglucosamine 6-O) Sulfotransferase 4 (CHST4, Accession NM_005769). Accordingly, utilities of VGAM1145 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHST4. Chloride Intracellular Channel 4 (CLIC4, Accession NM_013943) is another VGAM1145 host target gene. CLIC4 BINDING SITE is HOST TARGET binding site found in

the 3' untranslated region of mRNA encoded by CLIC4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLIC4 BINDING SITE, designated SEQ ID:15128, to the nucleotide sequence of VGAM1145 RNA, herein designated VGAM RNA, also designated SEQ ID:3856.

[41263] Another function of VGAM1145 is therefore inhibition of Chloride Intracellular Channel 4 (CLIC4, Accession NM_013943). Accordingly, utilities of VGAM1145 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLIC4. FLJ11274 (Accession NM_018375) is another VGAM1145 host target gene. FLJ11274 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ11274, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11274 BINDING SITE, designated SEQ ID:20398, to the nucleotide sequence of VGAM1145 RNA, herein designated VGAM RNA, also designated SEQ ID:3856.

[41264] Another function of VGAM1145 is therefore inhibition of

FLJ11274 (Accession NM_018375). Accordingly, utilities of VGAM1145 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11274. FLJ12903 (Accession NM_022753) is another VGAM1145 host target gene. FLJ12903 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12903, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12903 BINDING SITE, designated SEQ ID:22976, to the nucleotide sequence of VGAM1145 RNA, herein designated VGAM RNA, also designated SEQ ID:3856.

[41265] Another function of VGAM1145 is therefore inhibition of FLJ12903 (Accession NM_022753). Accordingly, utilities of VGAM1145 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12903. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1146 (VGAM1146) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes

is known in the art.

[41266] VGAM1146 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1146 was detected is described hereinabove with reference to Figs. 1–8.

[41267] VGAM1146 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox Virus. VGAM1146 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[41268] VGAM1146 gene encodes a VGAM1146 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1146 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1146 precursor RNA is designated SEQ ID:1132, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1132 is located at position 218150 relative to the genome of Fowlpox Virus.

[41269] VGAM1146 precursor RNA folds onto itself, forming VGAM1146 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two–

dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[41270] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1146 folded precursor RNA into VGAM1146 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM1146 RNA is designated SEQ ID:3857, and is provided hereinbelow with reference to the sequence listing part.

[41271] VGAM1146 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1146 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1146 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein cod-

ing region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.
